P R E F A C E

Realizing the need for a sound meteorological data base for planning and development of water resources on a river basin basis, the Government of India through Ministry of water resources, River development and Ganga Rejuvenation has been making efforts to develop data bases covering all aspects of meteorological cycle. Reliable and continuous records of water resources data are essential for the optimum development of water resources. Conducting meteorological observations in addition to the hydrological observations in all-important river basins of India has, therefore, been one of the main activities of the Central Water Commission (CWC).

Meteorological observations of Godavari basin were started by CWC early 1960. However, the Meteorological Year Book, as a publication, has been started recently. This Meteorological Year Book contains rainfall and climatic data for the year 2017-18 (June 2017 to May 2018) collected at 69 meteorological stations maintained by CWC in Godavari basin.

This publication contains the daily rainfall and Max.-Min. temperatures, Evaporation, Wind directions, Humidity and Wind velocity during 2017-18 at these sites, in the data sheets appended.

Three field divisions of CWC, viz., Upper Godavari Division, Lower Godavari Division, Hyderabad under the control of Godavari Circle and Wainganga Division, Nagpur under the control of Superintending Engineer (Co-ordination), Nagpur have contributed in bringing out this Meteorological Year Book which is duly acknowledged.

GODAVARI BASIN
METEOROLOGICAL DATA
(JUNE 2017– MAY 2018)

1.1 Scope

Central Water Commission is conducting Hydro -Meteorological observations in Godavari Basin at 70 Meteorological stations which were established under different schemes viz. under K.G. Commission report (19 stations), 163 Key stations scheme (13 stations), 163 Key stations-Plans scheme (13 stations), 80 key-H.O K.G.B non plan scheme (8 stations), Flood Forecasting Plan Scheme (17 stations). All these stations are located in the states of Maharashtra, Telangana, Andhra Pradesh, Madhya Pradesh, Chhattisgarh, Orissa and Karnataka.

1.2 SOURCE OF INFORMATION

During the year 2017-18 Meteorological observation have been conducted at 70 stations in the Godavari Basin under three field divisions of Central Water Commission viz. Upper Godavari Division, Hyderabad (25 stations), Lower Godavari Division, Hyderabad (24 stations), Wainganga Division, Nagpur (21 stations).

1.3 BASIN DESCRIPTION

River Godavari is the largest of the peninsular rivers, and third largest in India. It drains through the states of Maharashtra, Telangana, Andhra Pradesh, Madhya Pradesh, Chhattisgarh, Orissa and Karnataka. The Godavari basin is situated between North latitudes $16^{\circ} 16' 00''$ to $22^{\circ} 36' 00''$ and East longitudes $73^{\circ} 26' 00''$ to $83^{\circ} 07' 00''$. After flowing for about 1,465 km, in South-East direction, it falls into the Bay of Bengal. The Godavari river is having drainage area of 3, 12, 812 sq.km.

Table No.2: State wise distribution of drainage area

Sl.No	Name of the State	Drainage Area (km²)	% of Area
1	Andhra Pradesh	15373	4.9
2	Orissa	17752	5.7
3	Chhattisgarh	34095	10.9
4	Telangana	57828	18.5
5	Maharashtra	152199	48.6
6	Karnataka	4405	1.4
7	Madhya Pradesh	31160	10.0

River Godavari rises at an elevation of 1,067 m just West of Thriambak and flows from south to east through the states of Maharashtra, Karnataka, Madhya Pradesh, Chhattisgarh, Orissa, Telangana and Andhra Pradesh before it joins the Bay of Bengal. The total length river from its origin to outfall into the sea is 1465km.

About 64 km. from the origin, the Godavari has joined by Dharna, on its right bank and a short distance downstream, the Kadava joins it from the left. The combined waters of the Pravara and Mula which rise in the hills of Akola join the river from right about 217 km. from the origin. About 338 km. from the origin, the river receives the combined waters from the Purna and Dudhna rivers and after a further 138 km. at the border of Maharashtra and Telangana state, the waters of the Manjira river joins it from the South. At this point, Godavari flows at an elevation of about 329 m. The river Pranhita, conveying the combined waters of Penganga, the Wardha and Wainganga, which drain Nagpur and southern slopes of the Satpura ranges, falls into Godavari about 306 km. below its confluence with the Manjira. The waters of the Indravathi join the river Godavari 48 Km downstream in Telangana state. The last major tributary is the Sabari, which joins the Godavari, 100 km. up-stream of Rajahmundry in Andhra Pradesh. The largest tributary of the Godavari is the Pranhita with about 34.87% coverage of drainage area. The Pravara, Manjira and Maner are right bank tributaries covering about 16.14%, the Purna, Pranhita, Indravathi and Sabari are important left bank tributaries, covering nearly 59.7% of the total catchment area of the basin. The Godavari in the upper, middle, and lower reaches make up for the balance 24.16%. Godavari is divided into 12 sub basins consisting of 9 tributaries and 3 parts of main Godavari. The salient features of 12 sub-basins along with No. of rain gauge stations established in each sub basin are tabulated below.

Table No.3

Sl. No	Name of the River	Elevation of Source	Length of Tributary (km)	Catchment area (sq.km.)	Average annual rainfall (mm)	No. of Rain Gauge stations
1	Upper Godavari (source to Manjira confluence)	1,067	675	33502	770	12
2	Pravara	1,050	208	6537	606	1
3	Purna	838	373	15579	797	3
4	Manjira	823	724	30844	846	6
5	Middle Godavari (between confluence points Manjira and Pranhita)	323	328	17205	955	3
6	Maner	533	225	13106	932	-
7	Penganga	686	676	23898	960	3
8	Wardha	777	483	24087	1055	15
9	Pranhita	640	721	61093	1363	2
10	Lower Godavari (Pranhita confluence to sea)	107	462	24869	1208	11
11	Indravati	914	535	41665	1588	10
12	Sabari	1,372	418	20427	1433	4

At present about 350 Major, Medium projects existing in Godavari River Basin. Dowlaishwaram Barrage (Cotton Barrage) and many other projects are under construction. Few important projects are Jalaput dam, Balimela Dam, Upper Kolab, Nizamsagar Project, Sriram Sagar Project(SRSP), Singur Dam, Babli Barrage, Devadula Lift Irrigation project, Yellam palli project, Polavaram Project, Inchampalli Project, Kaddam Project, Manjira Reservoir, Lower Tirna, Purna (Siddeswar), Isapur Dam (Upper Penganga), Upper Dudhna Dam, Jaikwadi Dam (Paithan), Bhandara Reservoir, Mula Reservoir, Upper Pravara, Upper Indravati Project, Karanja Project, Upper, Middle and Lower Maner Reservoir, Mula Irrigation Project, Pench Projects, Projects in Sileru (Machkund) Basin, Upper Wainganga and Majlegaon Irrigation project etc.

1.4 PAST RECORDS OF METEOROLOGICAL DATA

1.4.1 GROUP 'A' SITES:

Meteorological observations like Rainfall, Maximum- Minimum temperature, Wind velocity, Evaporation and Humidity are being conducted at various stations. During the year 2017-18, Rainfall observations were conducted at the 69 stations where as Maximum-Minimum temperature observations at 47 stations, Wind velocity, Humidity, Evaporation observations at 2 stations. The parameter observed and historical data availability at 69 stations is show in Table-4.

Table No. 4

Sl.N o	Name of the Station	Date of inception/Historical data availability				
		Rain fall	Max.MIN Temp.	Wind velocity	Humidity	Evaporation

Note: Up to 31.05.98 the meteorological data viz. Rainfall, Maximum- Minimum temperature, Wind Velocity, Humidity and Evaporation were published in the form of ten daily values and from 01.06.98 onwards all the above data are published in the form of daily-observed values.

1.5 OBSERVATION TECHNIQUE

Meteorological observations at GDQ/GDSQ site are recorded regularly at 08.30hrs. The Meteorological instruments are installed in the premises of the site offices. The data observed at sites is sent to Division office for further processing. The observation technique applied for the collection of Meteorological data is given below.

1.5.1 RAIN FALL

Accuracy in the measurement of rainfall is of great importance in almost every field of its application and is significant in agriculture, irrigation, design of waterways, flood control, power generation and conservation of water resources at national and international levels.

The Ordinary Rain-gauge (ORG) is made of fiberglass reinforced plastic material as per Indian Standard Specification No. IS 5225: 1992 (old version 5225-1969) is used at the sites. The details of ORG installed at sites are given below.

Measuring capacity of Rainfall in mm	Collector Nominal	Base	Bottle
100	200 cm ²	Small	2 liter
200	200 cm ²	Small	4 liter

Both the above 100 and 200 mm rainfall rain gauges are identical except for the bottle used. The rain gauges capacity can be changed by interchanging the collector bottles of different capacities. The 2 liter bottle is used only in regions where rainfall between two observations is likely to be less than 100 mm or where an additional cylinder is used to collect the overflow, if any, from the bottle. The rim diameter of the collector is 159.6 mm. The base and the collector are locked together by a set of two locking rings fixed firmly to the two parts.

Besides, a hasp and staple is provided to permanently lock the rain gauge with a padlock. Care is taken that the rain gauge is not installed on the ground that falls away steeply on the side of prevailing wind. Its distance from every object is generally kept four times the height of the object and never less than twice the height of the object, above rim of the gauge.

Rainfall is measured in terms of the depth of the water, which would be collected upon a level area of any size, assuming the rain to fall uniformly over the area at the rate which it falls uniformly over the area of rim collector of rain gauge. Thus, one centimeter of rainfall means that if the rain were to fall on the level surface which does not absorb it and from which it cannot run off or evaporate, it would form a sheet of water one centimeter in depth. To measure the rainfall, the water collected in the receiving bottle is poured in to especially graduated glass cylinders manufactured according to Indian Standard Specification No. IS: 4849-4968. Care is taken to avoid spilling of the collected water.

As per their requirement, Indian Meteorological Department (IMD) has installed the rain gauges at some of the selected sites of CWC. The rainfall data from these sites is communicated to IMD, Pune as per their time schedule. At the remaining sites the rain gauges have been installed by field divisions of Central Water Commission. The date of installation of rain gauges (both ORG & SRRG) and the names of the agencies maintaining them is given at Table 5

1.5.2 MAXIMUM MINIMUM TEMPERATURE

As general purpose maximum and minimum thermometer is used at sites for registering extremes of temperature during a day i.e, 24 hrs. The thermometer of 'A' pattern having range -40°C to $+60^{\circ}\text{C}$ with smallest scale divisions equivalent to 1.0°C (IS: 7000-1973) is generally used.

The thermometer is exposed in wooden louvered enclosure known as Stevenson screen, which support the thermometers and shield them from direct radiation from outside sources and from precipitation while allowing free circulation of air around them, and prevent accidental damage.

1.5.3 WIND VELOCITY

The accurate measurement of wind velocity is of great importance in meteorological research and practice, agriculture, transport, shipping, industry, engineering and in many other fields of human activity. The simplest and most common method of measuring wind

velocity is by the use of a Cup Counter Anemometer in which the run of wind is indicated directly on a revolution counter. From the readings of the counter at the beginning and the end of a specified period i.e. one day, the mean wind velocity over the period is calculated.

The instrument specified in Indian Standard Specification No. IS:5912-1970 is used for this purpose at sites. The instrument is fixed at the top of a pole erected /roof top in the site office premises. The instrument has a cup wheel consisting of three conical cups with beaded edges, free to rotate in a horizontal plane. The cup wheel spindle is connected by worm gearing to a revolution counter mounted inside a waterproof housing. The gear ratio between the cup and counter spindles is so chosen that the run of the wind is shown.

1.5.4 HUMIDITY

Humidity data is of great importance in agriculture, Irrigation, ware housing especially for grains, transport, tourism, and meteorological research and in many other field of human activity. The simplest and most common method of measuring humidity is by the use of Dry & Wet bulb thermometer. The range of these thermometers is from -10° C to 50° C with smallest scale division's equivalent to 1.0° C. These thermometers are exposed in Stevenson screen. By the observed temperature from both these thermometers, humidity is determined from Hygrometric table.

1.5.5 EVAPORATION

The measurement of the amount of water evaporated from the soil and from free water surfaces is of great importance in agriculture, hydro meteorological studies, in the design, operation of reservoirs, and in irrigation and drainage systems. The rate of evaporation is defined as the amount of water lost by evaporation from a unit surface area, in unit time. This is proportionate to depth of water lost in unit time. The unit time is generally a day and the unit depth is in millimeters.

Evaporation is measured at sites using a Pan Evaporimeter. The values obtained with Pan Evaporimeter do not give directly the evaporation from a surface representative of natural conditions. They indicate, however, the order of magnitude of evaporation from such surfaces and comparative results over different areas need to be obtained by using identical instruments and similar exposures.

The pan Evaporimeter as specified in Indian Standard Specification No. IS: 5973-1970 is used at sites for observing evaporation data. The instrument consists of a cylindrical reservoir of fixed diameter and depth, filled with water to few centimeters below to rim. A fixed point gauge in a stilling well serves to indicate the level of water at each observation to bring the water level to the fixed point. The cross sectional area of the measuring cylinder is such that the number of millimeters of water added from the measuring cylinder divided by 100 gives the amount of water in millimeters which has been evaporated from pan during a given interval of time. The reservoir is covered with wire mesh netting to protect the pan from birds and animals. A thermometer suspended from mount clamped to the side of the reservoir records the temperature of the water in the pan.

2 Meteorological Data

2.1 Explanatory Notes

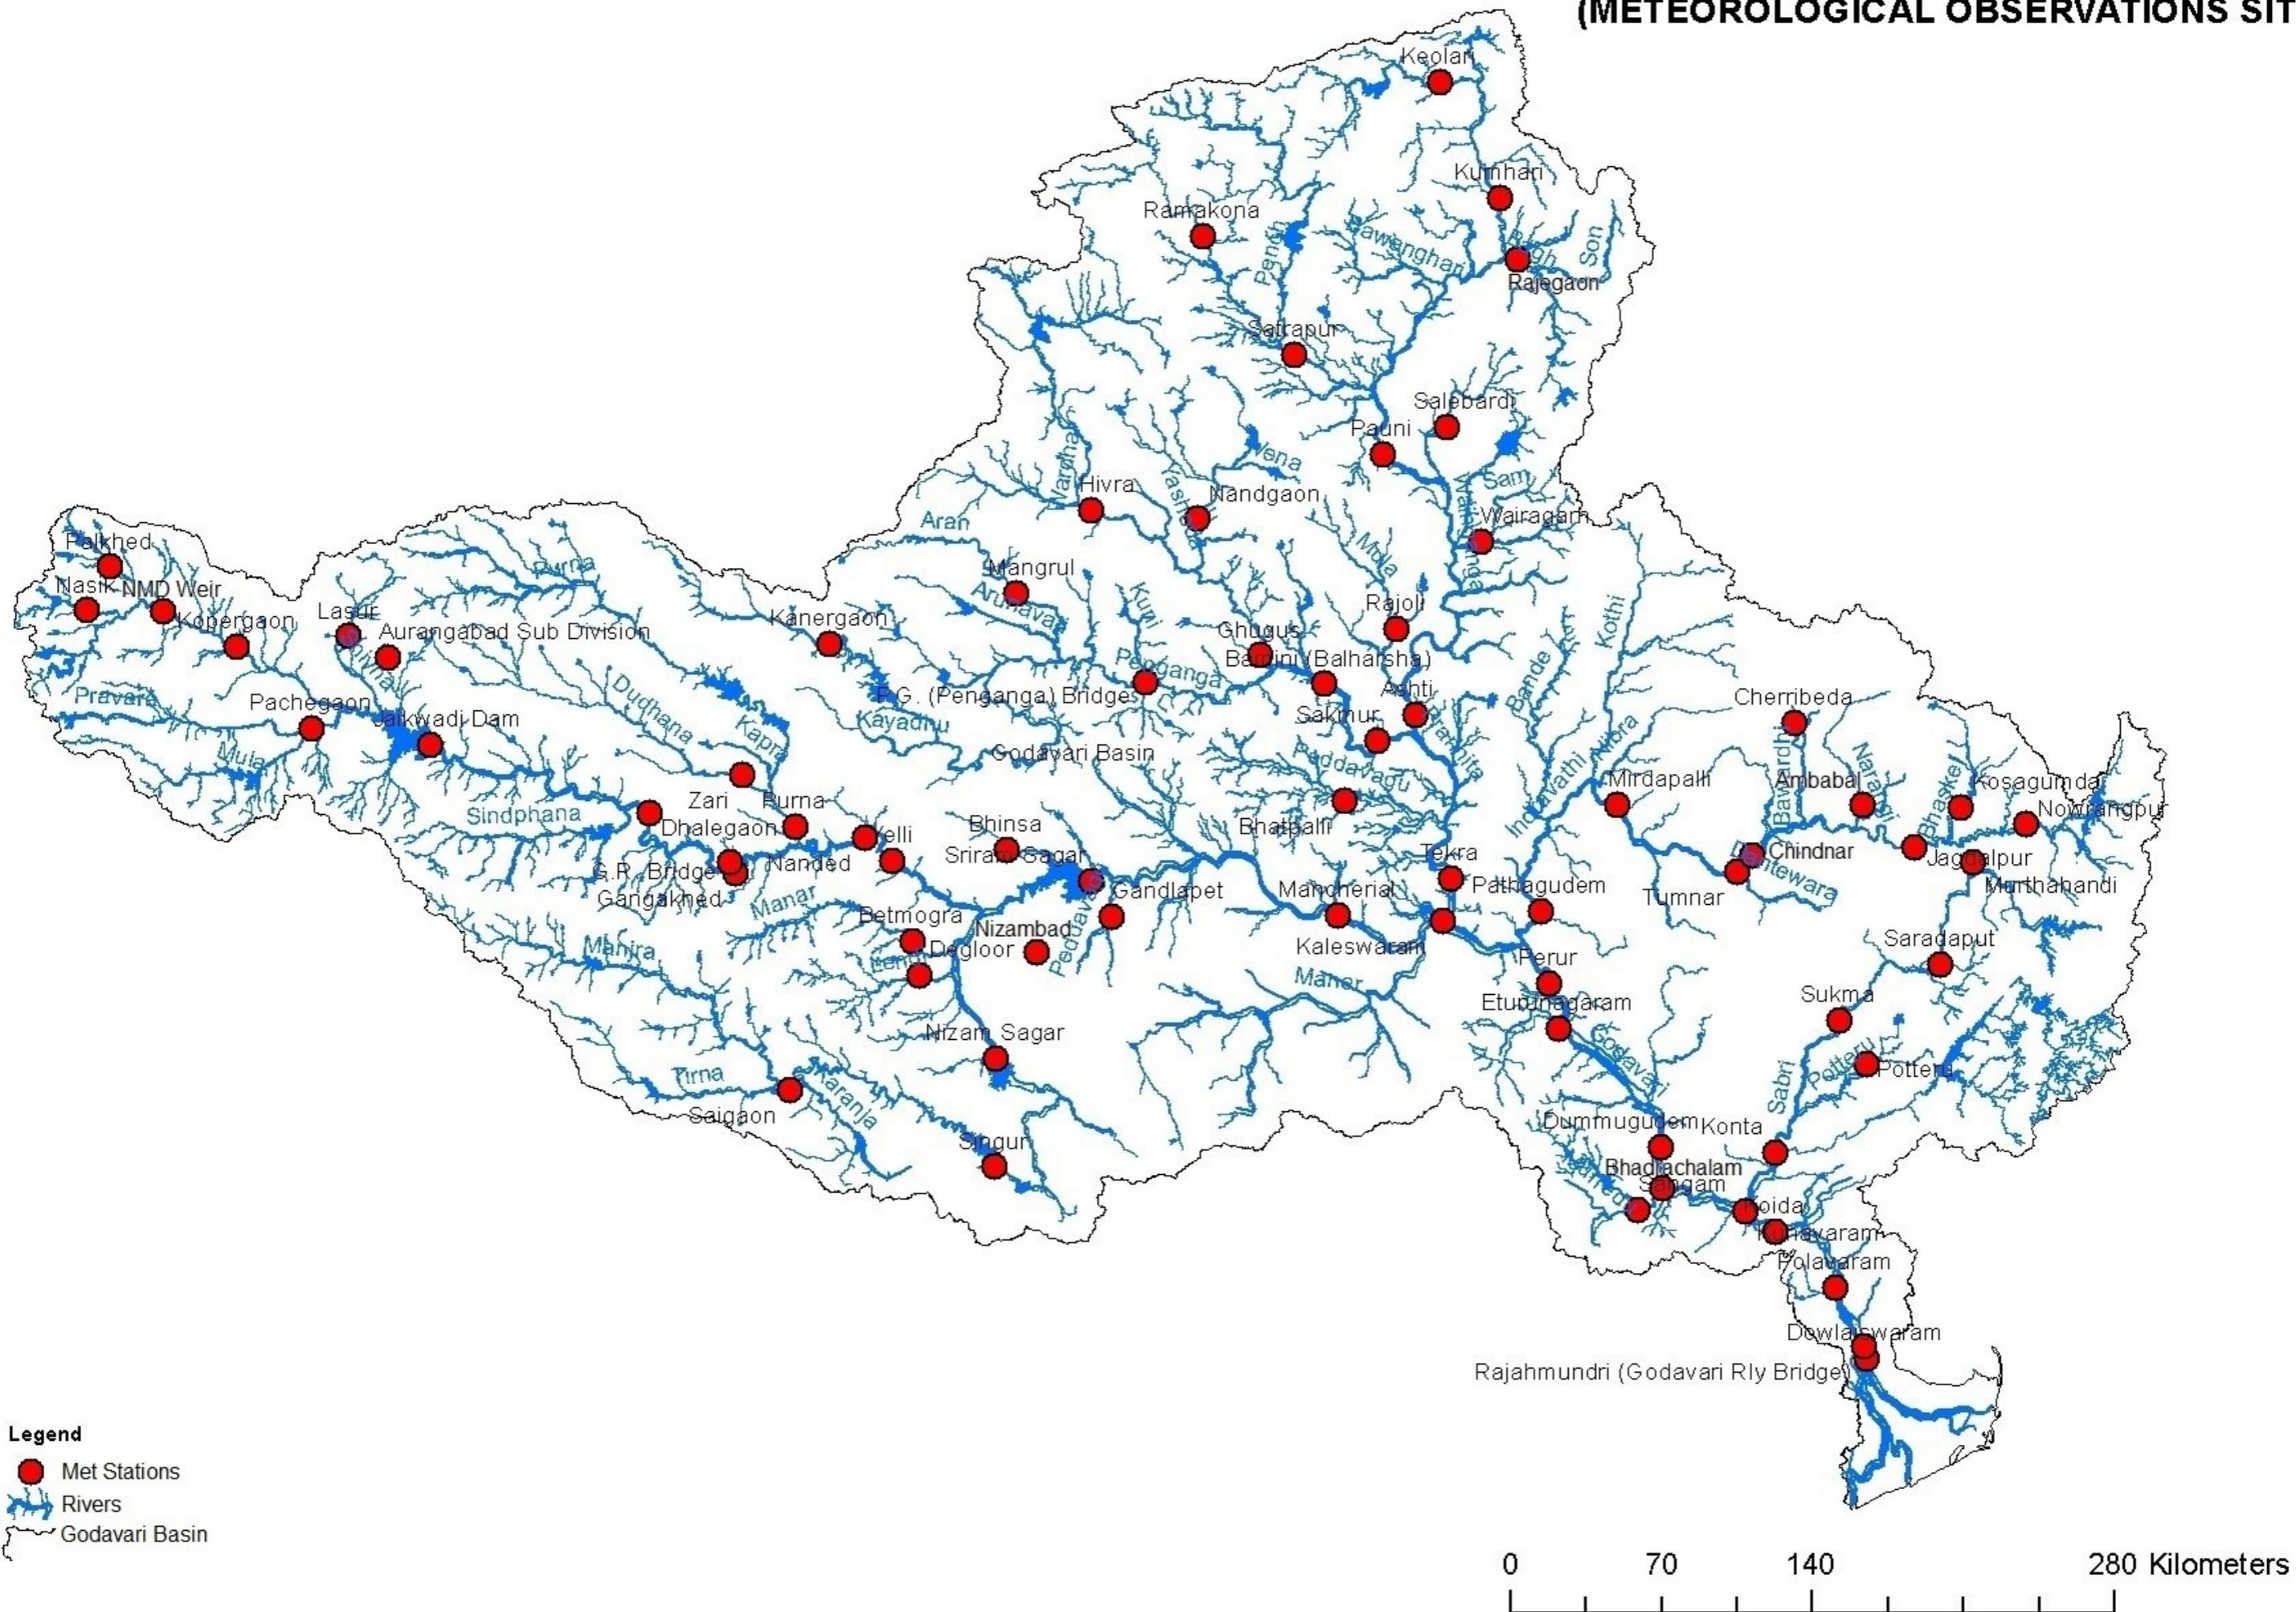

The explanatory notes described here under is to assist in the interpretation of Meteorological parameters contained in the data presented here.

1. Meteorological parameters are observed at sites regularly at 08.30 hrs.
2. Water year ranges from 1st June of one calendar year to 31st May of the next calendar year and covers one complete Hydrological cycle.
3. Measuring authority refers to the field division responsible for the collection of Meteorological data.
4. All the Meteorological data viz. Maximum- Minimum temperature, Wind Velocity, Humidity and Evaporation is published in the form of daily observed data keeping in view of its utility in designing of hydrological, hydropower projects and for agriculture purposes etc.

2.2 Method of presentation

In the succeeding pages, station wise Meteorological data (daily observed) are presented containing Maximum-Minimum temperature, Wind Velocity, Evaporation, Humidity and Rainfall data. The sequence of stations is arranged from the origin of the river to mouth giving the priority to an intermediate tributary station in a similar fashion.
