## **P R E F A C E**

One of the main functions of the Central Water Commission (CWC) is monitoring of river water quality in all the important river basins of India. For River Godavari and its tributaries water quality monitoring is carried out as a part of hydrological observation programme. River Water Samples are collected from the hydrological stations maintained by the CWC and analysed in the laboratories set up at divisional headquarters. The water quality data thus generated is published every year in the form of Water Quality Year Book.

For Godavari basin the Water Quality is monitored at 31 hydrological observation stations (Upper Godavari Division-8, Lower Godavari Division-8, Wainganga Division-15). The water samples collected from the hydrological stations under Godavari Circle are being analysed at Level-III Water Quality Laboratory, Upper Godavari Division, Hyderabad and those collected from hydrological stations under Wainganga Division are being analysed at Level II Water Quality Laboratory at Nagpur.

The water samples received in the respective laboratories are analysed for physical, chemical, biological & bacteriological parameters, organo-chloro pesticides and trace & toxic elements. In addition to above, parameters six chemical indices are derived mathematically based upon the observed data. Then the waters are classified with the help of US Salinity Diagram.

The Water Quality Year Book is useful to all the water resources planners, managers and water users in Godavari basin. Its usefulness will further improve, particularly for planning drinking water supply, irrigation, and industrial and sewage disposal schemes.

## **1.0 INTRODUCTION**

The Godavari is the largest river in South India extending over nearly 10% of Geographical area of the country. The total catchment area of the Godavari basin is 3,12,812 sq. km., draining parts of the states of Maharashtra, Karnataka, Madhya Pradesh, Chhattisgarh, Orissa ,Telangana and Andhra Pradesh. The river Godavari rises at an elevation of 1,067 m in the Western Ghats near Thriambak Hills in the Nasik district of Maharashtra. After flowing for about 1,465 km., in generally south-east direction, through Maharashtra, Telangana and Andhra Pradesh, it falls into the Bay of Bengal. The Pravara, the Manjira and the Maner are the major right bank tributaries while the Purna, the Pranahita, the Indravati and the Sabari are the major left bank tributaries on the Godavari River.

### **1.1 Water Quality Monitoring in Godavari Basin**

The Central Water Commission is monitoring the quality of river water in the Godavari basin since 1978. This volume contains data on water quality monitored at 31 hydrological observation stations being operated by the Central water commission during the Water Year 2016-17. Out of these 31 water quality stations, 15 are monitored by the Wainganga Division, Nagpur and the remaining 16 are monitored by the Upper Godavari Division, Hyderabad in the Godavari Basin covered by the Godavari Circle at Hyderabad. These stations have been marked in the layout map.

For the analysis of river water samples in the Godavari Basin, two laboratories – Krishna & Godavari River Water Quality Laboratory, Level III at Hyderabad (attached to Upper Godavari Division) and Water Quality Laboratory, Level II at Nagpur (attached to Wainganga Division) are being maintained by the Central Water Commission.

### **1.2 Classification of Water Quality Station**

Based on the location of the water quality stations, they are classified as (i) Base line Stations, (ii) Flux Stations and (iii) Trend Stations.

**(i) Base line Stations:** These are the quality stations, where there is no influence of human activities on water quality. At these stations, water quality is monitored 4 times a year for perennial rivers and 3 to four 4 times a year for seasonal rivers.

**(ii) Flux Stations:** These stations are also known as impact stations. These stations meant for measuring the mass of particular pollutant on main river stream for measuring the extent of pollution due to human interference or geological feature at any point of time and are necessary for measuring impact of pollution control measures adopted. These stations shall be monitored 12 to 24 times in a year depending up on the pollution potential or importance of water use.

**(iii) Trend Stations:** These stations are designated for water quality monitoring to show how a particular point on a water course varies over time, normally, due to influence of human activities. These stations are monitored twelve times in a year.

## **2.0 WATER QUALITY DATA**

### **2.1 Back Ground Notes**

1. Water year commences from 1<sup>st</sup> June of the calendar year and extends to 31<sup>st</sup> May of the next calendar and covers one complete hydrologic cycle.
2. The month and year from which data are collected are indicated in the history sheet.
3. Based on Conductivity and Sodium Adsorption Ratio, the water samples have been classified as per U.S. Salinity Laboratory Standard, 1953.

### **2.2 Observation/Sampling Techniques**

A single grab sample at each station is collected on the designated dates from 10 to 20 cm below the water surface in the discharge measuring section from the flow portion of the stream.

Water samples are collected, in general, in two polythene/polypropylene bottles of one litre capacity – one for the analysis of physico-chemical parameters and the other one for analysis of biological parameters. Water sample meant for analysis of bacteriological analysis is collected in a sterilized glass bottle of 250 mL capacity whose mouth is sealed with aluminum foil. The water sample meant for analysis of pesticides is collected in amber colored glass bottle of one litre capacity and for analysis of Trace & Toxic elements collected in one litre capacity of polythene/ polypropylene bottle. The sample bottles are labeled and proper care is taken to ensure leak-proof.

The samples are transported in ice-boxes to the respective laboratories with a minimum loss of time to ensure that they reach the laboratories within 24 hours of

collection. The parameters like pH, electrical conductance, dissolved oxygen, carbonate & bicarbonate, Hardness (Ca, Total), coliforms (both Fecal and Total) and Ammonical Nitrogen are analyzed immediately after the receipt of water samples in the laboratory. Later the samples, after filtration through membrane filter papers, are preserved at 4°C for analysis of other parameters within the prescribed time periods.

### **2.3 Frequency of Sample collection**

For baseline and trend stations samples are collected once in a month and samples are collected thrice per month for flux stations.

The frequency of sampling for various parameters at various stations are summarized in Table 2.1.

**Table 2.1 Frequency of sampling in Godavari Basin during WY 2016-17**

<b>Parameters</b>	<b>Frequency</b>	<b>Stations</b>
Physico-Chemical including Boron	Once in a month	All stations under Godavari Basin
Biological	Once in a month	All stations under Godavari Basin

### **2.4 Analysis Techniques:**

The Water samples, received from different water quality monitoring stations, has been analyzed for different parameters by following the “STANDARD METHODS FOR THE EXAMINATION OF WATER AND WASTE WATER” – APHA, AWWA & WEF, and 22nd Edition.

#### **2.4.1 Wet Chemical analysis by Titrimetry:**

Titrimetry is used to estimate the quantities of total hardness, calcium, carbonate, bicarbonate, chloride, dissolved oxygen, biochemical oxygen demand and chemical oxygen demand. In this procedure, analysis has carried out to find the volume of a solution of accurately known concentration, which reacts quantitatively with the known volume of sample from which the concentration of the required parameter in the sample has evaluated.
