PREFACE

Water is a prime natural resource and basic human need. The National Water Policy lays stress on planning and development of water resources on a national perspective. The prime requisite of water resources planning is indeed an efficient information system on the quantity and quality of this time and space variable precious natural asset.

The Central Water Commission in its capacity as an apex technical organisation in the field of water resources development endeavours the gigantic task of collection and compilation of Water Quality data incorporating the quality and quantity of available waters in various basins of the country. The Water Quality Books of various river basins of the country are being published by Central Water Commission in order to make its effective and efficient use.

The present volume contains information and trend on various water quality parameters measured at **10 water quality stations on river Ghaghra** and its tributaries for the year 2016-2017.

The valuable guidance and inspiration of **Shri Pradeep Kumar, Member, RM**, CWC, New Delhi and **Shri S.K.Sibal, Chief Engineer**, Upper Ganga Basin Organisation, CWC, Lucknow is gratefully acknowledged.

I would like to place on record the special contribution made by **officers and staff of Hydrological Observation Circle, Varanasi and Middle Ganga Division-I, Lucknow** in compilation of information and publication of the report in present form.

It is hoped that this publication will be found useful for the planners, managers and users in the field of water resources.

1. INTRODUCTION

1.1. Scope

- 1.1.1. Rapidly increasing population, rising standard of living ,exponential growth of industrialized and urbanization have exposed the Water Resources in general and rivers in particular to various form of degradation. It is therefore necessary to keep vigilant watch of quality of available fresh waters whose major sources in our country are rivers.

1.2. Source of Information

Middle Ganga Division No. I, Lucknow under the Hydrological Observation Circle, Central Water Commission, Varanasi is conducting Water Quality observations at nine sites in Ghaghra sub-basin. The finalised data for the year 2016-2017 is presented in the book. The details of the site is given in Table 1 and same has been located in index map .

1.3. Observation Technique

Water samples from all the Water Quality stations are collected on 1st working day of the month and transported to divisional laboratory where systematic analysis is conducted for the determination of constituents like pH, Specific Conductance, Potassium (as K^+), Sodium (as Na^+), Calcium (as Ca^{++}), Magnesium (as Mg^{++}), Iron (as Fe^{++}), Nitrogen Ammoniacal (as $NH_4\text{-N}$), Carbonate (as CO_3^{--}), Bicarbonate (as HCO_3^-), Chloride (as Cl^-), Fluoride (as F^-), Sulphate (as SO_4^{--}), Nitrate (as NO_3^-), Nitrite (as NO_2^-), Phosphate (as PO_4^{---}), Silica (as SiO_2) and Boron (as B).

pH and Specific Conductance are determined by digital pH meter and conductivity meter. Cl^- , CO_3^{--} , HCO_3^- , Ca^{++} and Mg^{++} are estimated by titration method. SO_4^{--} is estimated by turbidimetric method with the help of Nephelometer. Na^+ and K^+ estimation is done by the method of flame emission with the help of Flame photometer and rest by the method of colorimetric estimation with the help of U-V Spectrophotometer.

In addition to the above, Dissolved Oxygen is also estimated. Biochemical Oxygen Demand, Chemical Oxygen Demand and Microbiological Parameters such as Total Coliform & Fecal Coliform are determined at selected sites.

2. WATER QUALITY DATA

2.1 Explanatory Notes

The explanatory notes, described hereunder, are designed to assist in the interpretation of various parameters contained in the data presented subsequently.

- i) The water samples are collected at a regular frequency of once in a month usually on the 1st working day from the main flowing portion of the stream.
- ii) Dissolved Oxygen is measured at the site laboratory/ Divisional Laboratory.
- iii) The other water quality parameters are analysed at the divisional laboratory.
- iv) Chemical Indices, namely, Hardness Number, Sodium Percentage, Sodium Adsorption Ratio and Residual Sodium Carbonate are calculated as follows :

- a. Hardness Number (HAR) is calculated by adding the total Ca^{++} and Mg^{++} in the sample expressed as equivalent parts of CaCO_3 .
 - b. Sodium Percentage (S.P.) is given by

$$\text{S.P.} = (\text{Na}^+ \times 100) / (\text{Ca}^{++} + \text{Mg}^{++} + \text{Na}^+ + \text{K}^+)$$

Ionic concentrations being in meq/litre.
 - c. Sodium Adsorption Ratio (S.A.R.) is given by

$$\text{S.A.R.} = \text{Na}^+ / \{(\text{Ca}^{++} + \text{Mg}^{++})/2\}^{1/2}$$

Where the ionic concentration being in meq/litre.
 - d. Residual Sodium Carbonate (R.S.C.) is given by

$$\text{R.S.C.} = (\text{CO}_3^{--} + \text{HCO}_3^-) - (\text{Ca}^{++} + \text{Mg}^{++})$$

Where concentration of all the ions being in meq/litre.
- v) Water year ranges from June 1st of one calendar year to May 31st of the next calendar year and covers one complete hydrological cycle.
- vi) The gauging station code number is a unique seven column alpha-numeric reference number which facilitates storage and retrieval of water quality data in data banks. The first column is identifier of either an integral river basin or for convenience, a region having several contiguous river catchments. This is followed by a column which identifies an independent river system which either have one or more outlets to the sea or crosses international border to enter another country. The third, fourth and fifth column spaces denote first, second and third order tributaries respectively from the mouth upstream. The sixth and seventh column spaces indicate the location of the gauging station in one of the 225 slots earmarked on the river. The blank column spaces are filled by zero.

2.2 Method of Presentation

In the succeeding pages, station-wise water quality data and its trend is presented, comprising history sheet and water quality analysis tables.

History sheet gives concise description of the water quality observation station. The water quality analysis tables are given season-wise (flood, winter, summer) for the river water. The samples of water quality analysis are collected once a month as already mentioned in para 2.1 above.

3. WATER QUALITY TOLERANCE AND CLASSIFICATION

As per ISI-IS: 2296-1982, the tolerance limits of parameters are specified as per classified use of water (Table 1,2,3,4,5 Annexed) depending on various uses of water. The following classifications have been adopted in India.

Classification	Type of use
Class A	Drinking water source without conventional treatment but After disinfection.
Class B	Outdoor bathing.
Class C	Drinking water source with conventional treatment followed by disinfection.
Class D	Fish culture and wild life propagation .
Class E	Irrigation , Industrial cooling or controlled waste disposal.

4.0 TREND ANALYSIS / SCENARIO IN GHAGHRA BASIN

The river Ghaghra rises in the southern slopes of the Himalayas in Tibet, in the glaciers of Mapchachungo. The river flows south through Nepal as the Karnali River and flows through one of the most deserted and least explored area of Nepal. Seti River is a 202 km long stream feeding this river and drains the western part of the catchment, and joins the Karnali River in Doti north of Dundras Hill. Another feeder stream is the Bheri river that is 264 km long and drains in the eastern part of the catchment and converges with the Karnali River near Kuineghat in Surkhet. Moving southwards across the Siwalik Hills, it splits into two branches, first Geruva on the left bank and Kauraliaon the right bank near downstream Chisapani to rejoin south of the Indian border and form the Ghaghra proper.

Middle Ganga Division-1, Lucknow, Central Water Commission, under Hydrological Observation Circle, Varanasi has established a network of three monitoring stations on river Ghaghra. Starting from up-stream, there are three Water Quality monitoring stations at the Ghaghra river named Elginbridge, Ayodhya and Turtipar. Ghaghra basin map showing various sites on Ghaghra and Rapti, other tributaries like Sharda, Kwano and Sarju is given below.

Major Rivers : River Ghaghra is the major river in Middle Ganga Division -I, Lucknow. Middle Ganga Division -I, Lucknow has established a network of 10 Water quality monitoring stations in Ghaghra Basin & Rapti Basin under its jurisdiction. This division is monitoring the water quality of Ghaghra at 3 site namely Elginbridge, Ayodhya and Turtipar and sites Balrampur, Bansi, Regauli and Birdghat at Rapti, Paliakalan at Sharda, Basti at Kwano and Ghat at Sarju. The monitoring of surface waters is done on monthly basis. Water samples are analysed for physico-chemical and bacteriological parameters apart from the field observations.

W.Q. Network : Details of water quality station under jurisdiction of Middle Ganga Division – I, Lucknow are tabulated below.

S.No.	Name of Site	River	Classification

Analysis : To study the water quality / scenario in river Ghaghra, BOD, DO, fluoride and TDS parameters have been considered. Average value of these parameter for the period since inception(Inception to May 2016), last 10 years (Jun 2006 to May 2016) and last one year (Jun 2015 to May 2016) has been depicted in tables and figures below.

4.2 River : RAPTI (River 2) : The Rapti's headwaters descent south from rugged highlands populated by Kham Magar. The western tributary Madi Khola rises in northwestern Rolpa and is joined by Lungri Khola draining northeastern Rolpa. The Mardi then crosses into Pyuthan. It is joined by east-flowing Arun Khola at Deviyan where it enters a gorge through the Mahabharat Range. Jhimruk Khola east of the Mardi mainly drains Pyuthan. Below the upper highlands, an alluvial valley opens where Bahun and Chhetri rice farmers irrigate paddy fields. At Cherneta, Pyuthan the Jhimruk approaches within 1.5 km of the Mardi. Below Chernetathe Jhimruk loop east, becoming the border between Pyuthan and Arghakhanchi district. Its valley narrows and steepens as it enters the Mahabharat Range. Partway through it joins the Mardi and the combined flow is then named the Rapti.

The Rapti flows to the north of Behraich district. After traversing about 130 km, it enters to the northern portion of the Gonda district. River Rapti is important left bank tributary of river Ghaghra.

At present water quality is being monitored at four stations namely Balrampur, Bansi, Regauli and Birdghat on this river.

4.3 River : SHARDA (River 3) : The river Sharda is known as river Maha Kali in origin. The traditional source of the Maha Kali is Lipmpiya Dhura in Pithoragarh district Uttarakhand. The geographic sources, however, are some five kms further north and some thousand meters higher streams emerging from glacier along the watershed. India's border with China's Tibet Autonomous Region follows this watershed. The Kali receives the right bank Dhauliganga. It passes a town Dharchula and receives the Gori Ganga at Jauljibi, exiting the high mountains that reach into alpine zone. The first important left bank tributary from Nepal, the Chameliya joins after flowing southwest from Nepal's Gurans Himal. A bazaar town Jhulaghat is on both sides of the river. Then the Kali receives the Sarju river.

The Kali exits hill region at Jogbudha Valley and receives two tributaries Ladhiya and Ramgun, then it enters the lower Siwalik hills. Tanakpur town is just above dam of Sharda Reservoir where water is diverted into an irrigation canal. The river exit the last hills into the Terai plains, passing town Banbasa and Mahendranagar. The international border then turns

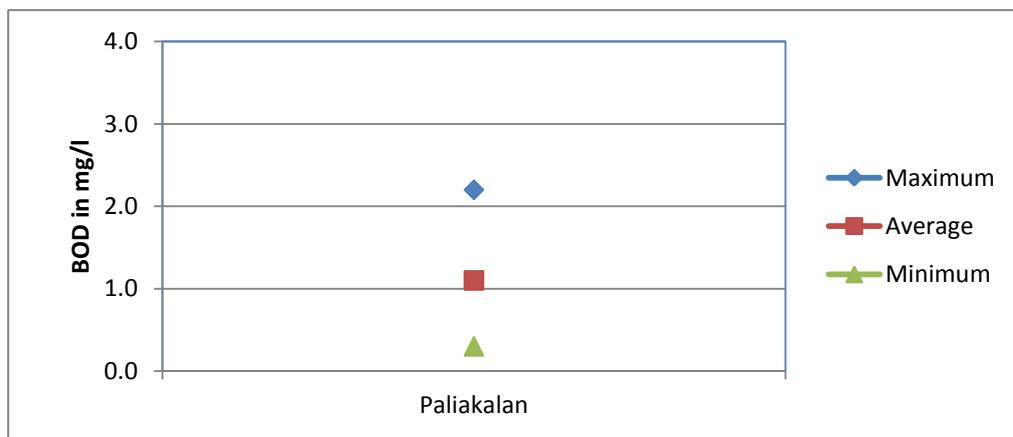

west of the river to follow a previous channel for some 10 km. here the river leaves Uttarakhand and crosses into Uttar Pradesh. Now the river's name changes to Sharda.

W.Q. Network :Water quality is being monitored on river Sharda at Paliakalan only.

5. General Remark / Conclusion about W.Q. trend –

River 1 Ghaghra :

The BOD value ranges from 0.4 – 2.2 mg/l and DO value is more than 6.0 mg/l which is within tolerance limit for Class A water.

The fluoride value ranged 0.05 - 0.34 mg/l , with maximum recorded during 2016-17 and the water is safe for human consumption with respect to fluoride.

The TDS value ranged between 107-230 mg/l .Tolerance limit for Class A is 500 mg/l.

The Total Coliform ranges between 1600 to 15000 and the maximum T. Coliform reported at Ayodhyay due to obvious reasons.

River 2 Rapti :

The BOD value ranges from 0.6 – 3.9 mg/l. However the average BOD is less than 2.0 mg/l for all sites.

The DO value ranged between 4.1 to 7.8 with average DO value more than 6.1 mg/l., which is within tolerance limit for Class A water.

The fluoride value ranged 0.05 – 0.44 mg/l and water is safe for human consumption with respect to fluoride.

The TDS value ranged between 117 – 266 mg/l.Tolerance limit for Class A is 500 mg/l.

Total Coliform ranges between 900 to 16000 MPN with highest being recorded at Birdghat site along which the city of Gorakhpur is located.

River 3 Sharda :

There is only one Water Quality monitoring Station on river Sharda at Paliakalan. The BOD value ranges from 0.3 – 2.2 mg/l which is within tolerance limit for Class A water. The DO value ranged between 4.5 to 10.0 mg/l with this years average being 6.8 mg/l. The fluoride value range is observed to be in between 0.00 to 0.44 mg/l and water is safe for human consumption with respect to fluoride. Average TDS value ranged between 108 – 438 mg/l with this years average value being 190 mg/l and is within the tolerance limit for Class A is 500 mg/l.

River 4 Kwano :

The BOD value ranged between 1.4 to 4.7 mg/l with this Years average BOD being 3.4 mg/l onl, which is slightly higher than Class A waters.. The DO value lies in between 2.0 to 7.4 mg/l. The fluoride levels vary in between 0.05 to 0.49 mg/l and water is safe for human consumption with respect to fluoride. TDS value lies in the range of 115 to 325 mg/l and is within the tolerance limit for Class A is 500 mg/l. Total Coliform in the river waters were found to be in the range of 1500-11000 MPN.

River 5 Sarju :

The BOD value lies in between 0.4 to 1.8 mg/l which is within tolerance limit for Class A water. The Average DO value is about 7.4 mg/l which is within tolerance limit for Class A water. The range of Fluoride values is between 0.11- 0.30 mg/l and water is safe for human consumption with respect to fluoride. TDS value varied between 96 - 207 mg/l. Tolerance limit for TDS for Class A is 500 mg/l. The Total Coliform values lies in between 700 – 5000 MPN.

In general the water quality of Ghaghra and its tributaries are till now within permissible limits /slightly above permissible limits for BOD, DO, TDC, Fluoride. The Total Coliform at all stations were found to be much above the permissible limits and is the only matter of concern for Ghaghra river/its Tributaries.

PREFACE

Water is a prime natural resource and basic human need. The National Water Policy lays stress on planning and development of water resources on a national perspective. The prime requisite of water resources planning is indeed an efficient information system on the quantity and quality of this time and space variable precious natural asset.

The Central Water Commission in its capacity as an apex technical organisation in the field of water resources development endeavours the gigantic task of collection and compilation of Water Quality data incorporating the quality and quantity of available waters in various basins of the country. The Water Quality Books of various river basins of the country are being published by Central Water Commission in order to make its effective and efficient use.

The present volume contains information and trend on various water quality parameters measured at **10 water quality stations on river Ghaghra** and its tributaries for the year 2016-2017.

The valuable guidance and inspiration of **Shri Pradeep Kumar, Member, RM**, CWC, New Delhi and **Shri S.K.Sibal, Chief Engineer**, Upper Ganga Basin Organisation, CWC, Lucknow is gratefully acknowledged.

I would like to place on record the special contribution made by **officers and staff of Hydrological Observation Circle, Varanasi and Middle Ganga Division-I, Lucknow** in compilation of information and publication of the report in present form.

It is hoped that this publication will be found useful for the planners, managers and users in the field of water resources.

1. INTRODUCTION

1.1. Scope

- 1.1.1. Rapidly increasing population, rising standard of living ,exponential growth of industrialized and urbanization have exposed the Water Resources in general and rivers in particular to various form of degradation. It is therefore necessary to keep vigilant watch of quality of available fresh waters whose major sources in our country are rivers.

1.2. Source of Information

Middle Ganga Division No. I, Lucknow under the Hydrological Observation Circle, Central Water Commission, Varanasi is conducting Water Quality observations at nine sites in Ghaghra sub-basin. The finalised data for the year 2016-2017 is presented in the book. The details of the site is given in Table 1 and same has been located in index map .

10.	Bansi at Rapti	GGU30N9

1.3. Observation Technique

Water samples from all the Water Quality stations are collected on 1st working day of the month and transported to divisional laboratory where systematic analysis is conducted for the determination of constituents like pH, Specific Conductance, Potassium (as K^+), Sodium (as Na^+), Calcium (as Ca^{++}), Magnesium (as Mg^{++}), Iron (as Fe^{++}), Nitrogen Ammoniacal (as $NH_4\text{-N}$), Carbonate (as CO_3^{--}), Bicarbonate (as HCO_3^-), Chloride (as Cl^-), Fluoride (as F^-), Sulphate (as SO_4^{--}), Nitrate (as NO_3^-), Nitrite (as NO_2^-), Phosphate (as PO_4^{---}), Silica (as SiO_2) and Boron (as B).

pH and Specific Conductance are determined by digital pH meter and conductivity meter. Cl^- , CO_3^{--} , HCO_3^- , Ca^{++} and Mg^{++} are estimated by titration method. SO_4^{--} is estimated by turbidimetric method with the help of Nephelometer. Na^+ and K^+ estimation is done by the method of flame emission with the help of Flame photometer and rest by the method of colorimetric estimation with the help of U-V Spectrophotometer.

In addition to the above, Dissolved Oxygen is also estimated. Biochemical Oxygen Demand, Chemical Oxygen Demand and Microbiological Parameters such as Total Coliform & Fecal Coliform are determined at selected sites.

2. WATER QUALITY DATA

2.1 Explanatory Notes

The explanatory notes, described hereunder, are designed to assist in the interpretation of various parameters contained in the data presented subsequently.

- i) The water samples are collected at a regular frequency of once in a month usually on the 1st working day from the main flowing portion of the stream.
- ii) Dissolved Oxygen is measured at the site laboratory/ Divisional Laboratory.
- iii) The other water quality parameters are analysed at the divisional laboratory.
- iv) Chemical Indices, namely, Hardness Number, Sodium Percentage, Sodium Adsorption Ratio and Residual Sodium Carbonate are calculated as follows :

- a. Hardness Number (HAR) is calculated by adding the total Ca^{++} and Mg^{++} in the sample expressed as equivalent parts of CaCO_3 .
 - b. Sodium Percentage (S.P.) is given by

$$\text{S.P.} = (\text{Na}^+ \times 100) / (\text{Ca}^{++} + \text{Mg}^{++} + \text{Na}^+ + \text{K}^+)$$

Ionic concentrations being in meq/litre.
 - c. Sodium Adsorption Ratio (S.A.R.) is given by

$$\text{S.A.R.} = \text{Na}^+ / \{(\text{Ca}^{++} + \text{Mg}^{++})/2\}^{1/2}$$

Where the ionic concentration being in meq/litre.
 - d. Residual Sodium Carbonate (R.S.C.) is given by

$$\text{R.S.C.} = (\text{CO}_3^{--} + \text{HCO}_3^-) - (\text{Ca}^{++} + \text{Mg}^{++})$$

Where concentration of all the ions being in meq/litre.
- v) Water year ranges from June 1st of one calendar year to May 31st of the next calendar year and covers one complete hydrological cycle.
- vi) The gauging station code number is a unique seven column alpha-numeric reference number which facilitates storage and retrieval of water quality data in data banks. The first column is identifier of either an integral river basin or for convenience, a region having several contiguous river catchments. This is followed by a column which identifies an independent river system which either have one or more outlets to the sea or crosses international border to enter another country. The third, fourth and fifth column spaces denote first, second and third order tributaries respectively from the mouth upstream. The sixth and seventh column spaces indicate the location of the gauging station in one of the 225 slots earmarked on the river. The blank column spaces are filled by zero.

2.2 Method of Presentation

In the succeeding pages, station-wise water quality data and its trend is presented, comprising history sheet and water quality analysis tables.

History sheet gives concise description of the water quality observation station. The water quality analysis tables are given season-wise (flood, winter, summer) for the river water. The samples of water quality analysis are collected once a month as already mentioned in para 2.1 above.

3. WATER QUALITY TOLERANCE AND CLASSIFICATION

As per ISI-IS: 2296-1982, the tolerance limits of parameters are specified as per classified use of water (Table 1,2,3,4,5 Annexed) depending on various uses of water. The following classifications have been adopted in India.

Classification	Type of use
Class A	Drinking water source without conventional treatment but After disinfection.
Class B	Outdoor bathing.
Class C	Drinking water source with conventional treatment followed by disinfection.
Class D	Fish culture and wild life propagation .
Class E	Irrigation , Industrial cooling or controlled waste disposal.

4.0 TREND ANALYSIS / SCENARIO IN GHAGHRA BASIN

The river Ghaghra rises in the southern slopes of the Himalayas in Tibet, in the glaciers of Mapchachungo. The river flows south through Nepal as the Karnali River and flows through one of the most deserted and least explored area of Nepal. Seti River is a 202 km long stream feeding this river and drains the western part of the catchment, and joins the Karnali River in Doti north of Dundras Hill. Another feeder stream is the Bheri river that is 264 km long and drains in the eastern part of the catchment and converges with the Karnali River near Kuineghat in Surkhet. Moving southwards across the Siwalik Hills, it splits into two branches, first Geruva on the left bank and Kauraliaon the right bank near downstream Chisapani to rejoin south of the Indian border and form the Ghaghra proper.

Middle Ganga Division-1, Lucknow, Central Water Commission, under Hydrological Observation Circle, Varanasi has established a network of three monitoring stations on river Ghaghra. Starting from up-stream, there are three Water Quality monitoring stations at the Ghaghra river named Elginbridge, Ayodhya and Turtipar. Ghaghra basin map showing various sites on Ghaghra and Rapti, other tributaries like Sharda, Kwano and Sarju is given below.

Major Rivers : River Ghaghra is the major river in Middle Ganga Division -I, Lucknow. Middle Ganga Division -I, Lucknow has established a network of 10 Water quality monitoring stations in Ghaghra Basin & Rapti Basin under its jurisdiction. This division is monitoring the water quality of Ghaghra at 3 site namely Elginbridge, Ayodhya and Turtipar and sites Balrampur, Bansi, Regauli and Birdghat at Rapti, Paliakalan at Sharda, Basti at Kwano and Ghat at Sarju. The monitoring of surface waters is done on monthly basis. Water samples are analysed for physico-chemical and bacteriological parameters apart from the field observations.

W.Q. Network : Details of water quality station under jurisdiction of Middle Ganga Division – I, Lucknow are tabulated below.

Analysis : To study the water quality / scenario in river Ghaghra, BOD, DO, fluoride and TDS parameters have been considered. Average value of these parameter for the period since inception(Inception to May 2016), last 10 years (Jun 2006 to May 2016) and last one year (Jun 2015 to May 2016) has been depicted in tables and figures below.

4.2 River : RAPTI (River 2) : The Rapti's headwaters descent south from rugged highlands populated by Kham Magar. The western tributary Madi Khola rises in northwestern Rolpa and is joined by Lungri Khola draining northeastern Rolpa. The Mardi then crosses into Pyuthan. It is joined by east-flowing Arun Khola at Deviyan where it enters a gorge through the Mahabharat Range. Jhimruk Khola east of the Mardi mainly drains Pyuthan. Below the upper highlands, an alluvial valley opens where Bahun and Chhetri rice farmers irrigate paddy fields. At Cherneta, Pyuthan the Jhimruk approaches within 1.5 km of the Mardi. Below Chernetathe Jhimruk loop east, becoming the border between Pyuthan and Arghakhanchi district. Its valley narrows and steepens as it enters the Mahabharat Range. Partway through it joins the Mardi and the combined flow is then named the Rapti.

The Rapti flows to the north of Behraich district. After traversing about 130 km, it enters to the northern portion of the Gonda district. River Rapti is important left bank tributary of river Ghaghra.

At present water quality is being monitored at four stations namely Balrampur, Bansi, Regauli and Birdghat on this river.

4.3 River : SHARDA (River 3) : The river Sharda is known as river Maha Kali in origin. The traditional source of the Maha Kali is Lipmpiya Dhura in Pithoragarh district Uttarakhand. The geographic sources, however, are some five kms further north and some thousand meters higher streams emerging from glacier along the watershed. India's border with China's Tibet Autonomous Region follows this watershed. The Kali receives the right bank Dhauliganga. It passes a town Dharchula and receives the Gori Ganga at Jauljibi, exiting the high mountains that reach into alpine zone. The first important left bank tributary from Nepal, the Chameliya joins after flowing southwest from Nepal's Gurans Himal. A bazaar town Jhulaghat is on both sides of the river. Then the Kali receives the Sarju river.

The Kali exits hill region at Jogbudha Valley and receives two tributaries Ladhiya and Ramgun, then it enters the lower Siwalik hills. Tanakpur town is just above dam of Sharda Reservoir where water is diverted into an irrigation canal. The river exit the last hills into the Terai plains, passing town Banbasa and Mahendranagar. The international border then turns

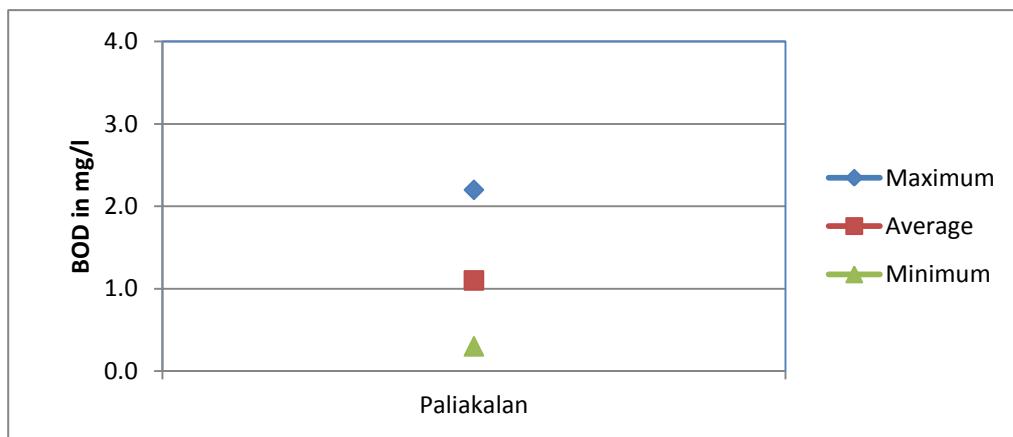

west of the river to follow a previous channel for some 10 km. here the river leaves Uttarakhand and crosses into Uttar Pradesh. Now the river's name changes to Sharda.

W.Q. Network :Water quality is being monitored on river Sharda at Paliakalan only.

5. General Remark / Conclusion about W.Q. trend –

River 1 Ghaghra :

The BOD value ranges from 0.4 – 2.2 mg/l and DO value is more than 6.0 mg/l which is within tolerance limit for Class A water.

The fluoride value ranged 0.05 - 0.34 mg/l , with maximum recorded during 2016-17 and the water is safe for human consumption with respect to fluoride.

The TDS value ranged between 107-230 mg/l .Tolerance limit for Class A is 500 mg/l.

The Total Coliform ranges between 1600 to 15000 and the maximum T. Coliform reported at Ayodhyay due to obvious reasons.

River 2 Rapti :

The BOD value ranges from 0.6 – 3.9 mg/l. However the average BOD is less than 2.0 mg/l for all sites.

The DO value ranged between 4.1 to 7.8 with average DO value more than 6.1 mg/l., which is within tolerance limit for Class A water.

The fluoride value ranged 0.05 – 0.44 mg/l and water is safe for human consumption with respect to fluoride.

The TDS value ranged between 117 – 266 mg/l.Tolerance limit for Class A is 500 mg/l.

Total Coliform ranges between 900 to 16000 MPN with highest being recorded at Birdghat site along which the city of Gorakhpur is located.

River 3 Sharda :

There is only one Water Quality monitoring Station on river Sharda at Paliakalan. The BOD value ranges from 0.3 – 2.2 mg/l which is within tolerance limit for Class A water. The DO value ranged between 4.5 to 10.0 mg/l with this years average being 6.8 mg/l. The fluoride value range is observed to be in between 0.00 to 0.44 mg/l and water is safe for human consumption with respect to fluoride. Average TDS value ranged between 108 – 438 mg/l with this years average value being 190 mg/l and is within the tolerance limit for Class A is 500 mg/l.

River 4 Kwano :

The BOD value ranged between 1.4 to 4.7 mg/l with this Years average BOD being 3.4 mg/l onl, which is slightly higher than Class A waters.. The DO value lies in between 2.0 to 7.4 mg/l. The fluoride levels vary in between 0.05 to 0.49 mg/l and water is safe for human consumption with respect to fluoride. TDS value lies in the range of 115 to 325 mg/l and is within the tolerance limit for Class A is 500 mg/l. Total Coliform in the river waters were found to be in the range of 1500-11000 MPN.

River 5 Sarju :

The BOD value lies in between 0.4 to 1.8 mg/l which is within tolerance limit for Class A water. The Average DO value is about 7.4 mg/l which is within tolerance limit for Class A water. The range of Fluoride values is between 0.11- 0.30 mg/l and water is safe for human consumption with respect to fluoride. TDS value varied between 96 - 207 mg/l. Tolerance limit for TDS for Class A is 500 mg/l. The Total Coliform values lies in between 700 – 5000 MPN.

In general the water quality of Ghaghra and its tributaries are till now within permissible limits /slightly above permissible limits for BOD, DO, TDC, Fluoride. The Total Coliform at all stations were found to be much above the permissible limits and is the only matter of concern for Ghaghra river/its Tributaries.
