P R E F A C E

A well developed Meteorological Data bank and maintenance of the data bank by regular updating are essential towards comprehensive planning and development of water resources on a river valley projects. To fulfil this national task, the Central Water Commission under the Union Ministry of Water Resources, River Development and Ganga Rejuvenation besides being an apex body on Water Resources Sector, has been maintaining a vast system of Hydrological & Meteorological data collection network stations in different River Basins in India.

Meteorological observations of West Flowing Rivers Basin were started by CWC in the early 1982. This book presented here contains the rainfall and climatic data for the year 2015-16 (June-2015 to May 2016) collected at 33 Meteorological stations maintained by CWC in the states of Maharashtra, Goa, Karnataka, Kerala, and Tamil Nadu.

This book of West Flowing Rivers Basin contains the daily rainfall, Max. Mini. temperatures, Evaporation, Wind Velocity & its direction, Humidity for the water year 2015-16.

The efforts made by the South Western Rivers Division, Kochi, Cauvery Division, Bengaluru, Southern Rivers Division, Coimbatore, under this Circle and Upper Krishna Division, Pune under Krishna & Godavari Basin Organization, Hyderabad in bringing out this Book deserves appreciation

**WEST FLOWING RIVERS BASIN
METEOROLOGICAL DATA
(JUNE 2015- MAY-2016)**

1.0 INTRODUCTION

1.1 SCOPE

Central Water Commission is conducting Meteorological Observations along with Hydrological, Sediment load, and Water Quality Observations and Flood Forecasting work etc. in the river basin throughout the country. Meteorological observations in West Flowing Rivers Basin are under the control of four field divisions of Central Water Commission namely Cauvery Division, Bengaluru (6 stations), Southern Rivers Division, Coimbatore (1 station) , South Western Rivers Division, Kochi, (22 stations) and Upper Krishna Division, Pune (4 stations). These stations are located in the state of Maharashtra, Goa, Karnataka, Tamil Nadu and Kerala.

1.2 SOURCES OF INFORMATION

The names of the 33 observation stations in the west flowing Rivers Basin for which meteorological data were collected during 2015-16 is as below

Sl. No.	Station Code No.	Name of station
1	WU000P8	Ulhas at Badlapur
2	WMA00I8	Kal at Mangaon
3	WL000M3	Kajvi at Anjanari

32	KF000E1	Tambraparni at Kuzhithurai
33	KE000G2	Pazhayar at Ashramam

1.3 BASIN DESCRIPTION

The West Flowing Rivers Basin consists of all the small independent river basins of peninsular India lying to the South of Krishna Basin (except Cauvery Basin) draining into the Arabian Sea. The basin is located in the South West corner of the peninsular India and covers the areas in the States of Maharashtra, Goa, Karnataka, Tamil Nadu and Kerala. There are as many as 31 Nos of medium and minor river basins in this region viz., Ulhas, Bhogeshwari, Amba, Kal, Kajavi, Gad, Mandovi/Madei, Aghanashini, Haladi, Sita, Swarna, Gurupur, Netravathi, Payaswani, Valatapatnam, Kuttayadi, Chaliyar, Kadalundi, Bharathapuzha, Chalakudi, Periyar, Muvattupuzha, Meenachil, Pamba, Achankovil, Manimala, Kallada, Vamanapuram, Pazhayar and Tambraparani.

All the rivers originate from the high mountains of the Western Ghats and exhibit similar characteristics. They have steep high banks which rarely overflow or cause floods.

Meteorological observations like Rainfall, Maximum- Minimum temperature, Wind velocity, Evaporation and Humidity are being conducted at various stations. During the year 2015-16 Rainfall observations were conducted at 20 stations where as Maximum-Minimum temperature observations at 33 stations, Wind velocity observation at 1 Station, Humidity observations at 5 stations and Evaporation data observations were conducted in 7 selected stations. The availability of data at various stations is shown in table below:-

Sl. No.	Name of Station	Date of Starting

1.4 OBSERVATION TECHNIQUE

Meteorological observations at GDQ/GDSQ site are recorded regularly at 08:30 hrs. The Meteorological instruments are installed in the premises of the site offices. The data observed at sites is sent to Division office for further processing. The observation technique applied for the collection of Meteorological data is given below.

1.4.1 Rainfall

Accuracy in the measurement of rainfall is of great importance in almost every field of its application and is significant in agriculture, irrigation, design of waterways, flood control, power generation and conservation of water resources at national and international levels.

The ordinary Rain-gauge (ORG) is made of fiber glass reinforced polyester material as per Indian Standard Specification No. IS 5225 :1992(old version 5225-1969). The details of ORG installed at sites are given below

Measuring capacity of Rainfall in mm	Collector Nominal	Base	Bottle
100	200cm ²	small	2 Liter
200	200cm ²	small	4 Liter
400	100 cm ²	small	4 Liter

Both the above 100 and 200 mm rainfall rain gauges are identical except for the bottle used. The rain gauges capacity can be changed by interchanging the collectors on the base and having bottles of different capacities. The 2 liter bottle is used only in regions where rainfall between two observations is likely to be less than 100 mm or where an additional cylinder is used to collect the overflow, if any, from the bottle. The rim diameter of the collector is 159.6mm. The base and collector are locked together by

a set of two locking rings fixed firmly to the two parts. Besides, a hasp and staple is provided to permanently lock the rain gauge with a padlock. Care is taken that the rain gauge is not installed on the ground that falls away steeply on the side of Prevailing wind. Its distance from every object is generally kept four times the height of the object and never less than twice the height of the object, above rim of the gauge.

Rainfall is measured in terms of the depth of the water, which would be collected upon a level area of any size, assuming the rain to fall uniformly over the area at the rate which it falls uniformly over the area of rim collector of rain gauge. Thus, one cm of rainfall means that if the rain were to fall on the level surface which does not absorb it and from which it cannot run off or evaporate, it would form a sheet of water one cm in depth. To measure the rainfall, the water collected in the receiving bottle is poured into graduated glass cylinders are manufactured accordingly to Indian Standard Specification No. IS: 4849-1968. Care is taken to avoid spilling of the collected water.

1.4.2 Maximum –Minimum Temperature

Temperature is a measure of the ability of a body (in this case the atmosphere) to communicate heat to other bodies and to receive heat from them (IMD definition).

Temperature varies primarily with the magnitude of solar radiation and observes cyclic diurnal and seasonal patterns. It is influenced at particular times by prevailing air masses and by the incursion of air masses from other source areas with different insolation properties and by prevailing cloudiness which limits incoming radiation. These factors limit the maximum and minimum temperatures which are expected at a given location for given season and time of day. They also limit the rates of change expected from hour to hour and from day to day.

Temperature is periodically observed (once or twice daily) using a set of four thermometers, located in a thermometer (or Stevenson) screen, which from its construction and installation provides a standard condition of ventilation and shade. The four thermometers are:

Dry bulb thermometer - measuring ambient air temperature

Wet bulb thermometer - which provides a basis for calculating relative humidity

Maximum thermometer- to indicate the highest temperature reached since the last setting

Minimum thermometer - to indicate the lowest temperature reached since the last setting.

Graduations are etched on the glass stem of the thermometer. In the case of the dry bulb, wet bulb and maximum thermometers, observations are of the position of the end of the mercury column but in the case of the minimum thermometer, the reading is taken of the position of the end of the dumb-bell shaped index furthest from the bulb. Each thermometer has a calibration card which shows the difference between the true temperature and that registered by the thermometer. Corrections for a given temperature are applied to each observation. When the maximum and minimum thermometers have been read they are reset (twice per day for minimum; once per day for maximum) using a standard procedure.

1.4.3 Wind Velocity

Wind speed is of particular importance in hydrology as it controls the advective component of evaporation. Wind speed exhibits wide variation not only from place to place but also shows strong diurnal variation at the same place. Wind flow and speeds are controlled by local pressure anomalies which in turn are controlled by the temperature. It may also be influenced by local topographic features which may funnel the wind and increase it above the areal average; conversely some stations will have wind speeds reduced by shelter. Extraordinary wind speeds may be experienced in some parts of the country through the incursion of tropical cyclones.

Wind speed is measured using an anemometer, usually a cup counter anemometer. The rate of rotation of the anemometer is translated by a gear arrangement to read accumulated wind total (km) on a counter. By observing the counter reading at the beginning and end of a period, the wind run over the period can be determined and the average speed over the interval can be determined by dividing by the time interval. Standard Indian practice is to measure the wind speed over a three minute period as representing an effectively instantaneous wind speed at the time of observation. Daily wind run or average wind speed is also calculated from counter readings on successive days at the principal observation times.

Wind direction is commonly measured and may be used in the calculation of evapotranspiration with respect to finding the fetch of the wind. It is observed using a wind vane and reported as 16 points of the compass either as a numerical figure or an alpha character.

1.4.4 Humidity

The standard means of assessing the relative humidity or moisture content of the air is by means of the joint measurement of dry bulb and wet bulb temperature. From these two measurements, the dew point temperature, actual

and saturated vapour pressures may also be calculated. The relative humidity (%) is the ratio of the actual vapour pressure to saturated vapour pressure corresponding to the dry bulb temperature. Whilst the actual vapour pressure may vary little during the day (except with the incursion of a new air mass), the relative humidity has a regular diurnal pattern with a minimum normally coinciding with the highest temperature (when the saturation vapour pressure is at its highest). It also shows a regular seasonal variation.

Wet and dry bulb thermometers used for temperature assessment also used for calculating various measures of humidity. The wet bulb is covered with a clean muslin sleeve, tied round the bulb by a cotton wick which is then led to a water container, by which the wick and muslin are kept constantly moist. The observer calculates the relative humidity from the wet bulb depression using a set of tables.

1.4.5 Evaporation

Evaporation is the process by which water changes from the liquid to the vapour state. Pan evaporation provides an estimate of open water evaporation. It is a continuous process in which the rate of evaporation depends on a wide range of climatic factors:

- Amount of incoming solar radiation (represented by sunshine hours)
- Temperature of the air and the evaporating surface
- Saturation deficit - the amount of water that can be taken up by the air before it becomes saturated (represented in measurement by the wet bulb depression)
- Wind speed

Evaporation again maintains a regular seasonal pattern with highest totals before the onset of the monsoon, during which evaporation is suppressed by decreasing saturation deficit. The standard measurement in India is made using the US Class A pan evaporimeter. It is a circular pan 1.22 m in diameter and 0.255 m deep. It rests on a white painted wooden stand and is maintained level. The pan is covered by a wire mesh to avoid loss of water due to birds and animals. The inner base of the pan is painted white. A stilling well is situated in the pan within which there is a pointer gauge. Measurement must take account not only of evaporation losses but also gains due to rainfall; the rain gauge nearby is used to assess the depth of rain falling in the pan.

On days without rain at daily (or twice-daily) reading, water is poured into the pan using a graduated brass cylinder (cup) to bring the level up precisely to the top of the pointer gauge. The number of cups (and part cups) is recorded and represents a depth of evaporation. On days with rain since the last observation the rainfall may exceed evaporation and water must be removed

from the pan to bring it to the hook level. The adjacent rain gauge is used to assess the rainfall inflow. On days with forecast heavy rainfall a measured amount of water may be removed from the pan in advance of the rainfall occurrence (to avoid pan overflow)

2.0 METEOROLOGICAL DATA

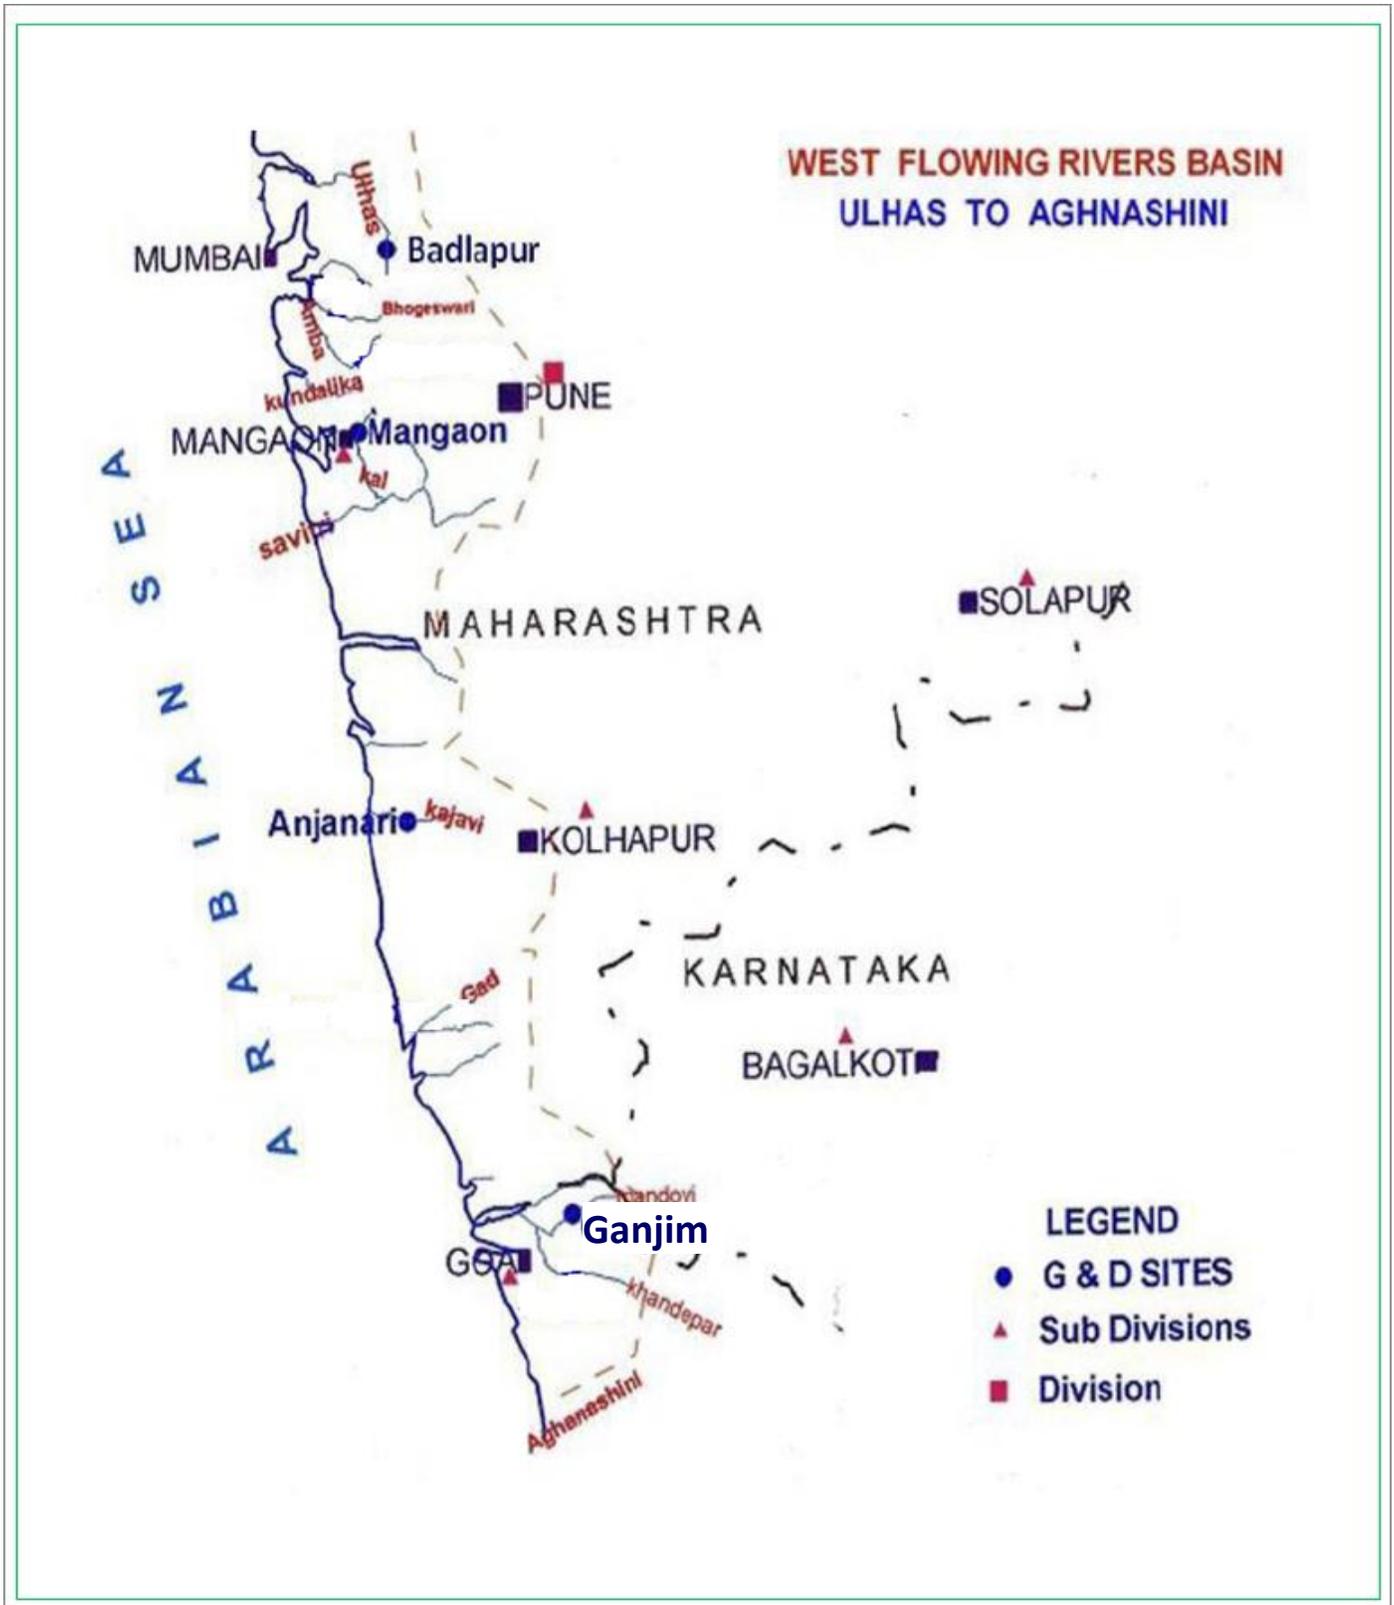

2.1 EXPLANATORY NOTES

The explanatory notes described here under are given to assist in the interpretation of Meteorological parameters contained in the data presented. The notes are, therefore, applicable in so far as the data presented in this book are concerned.

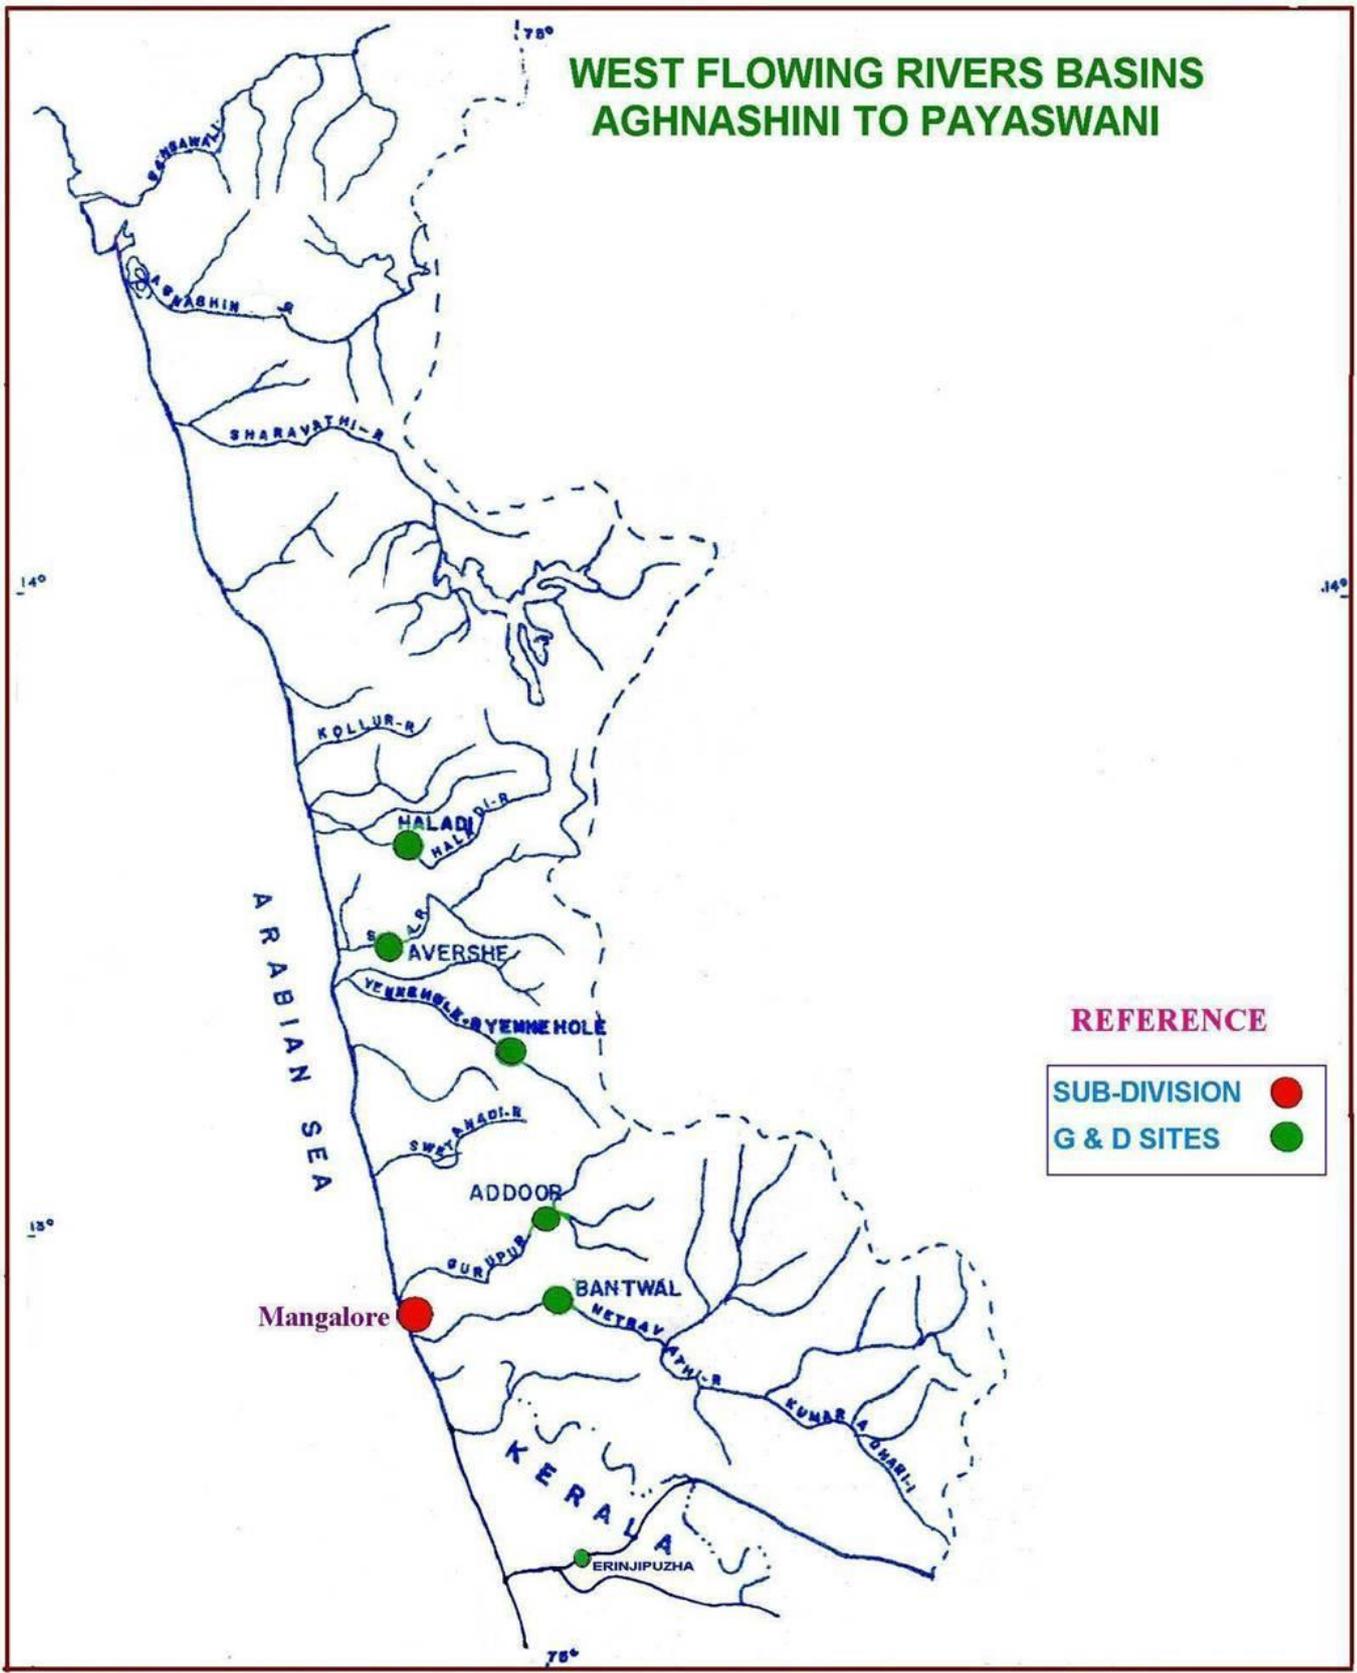

1. Meteorological parameters are observed at sites regularly at 08.30 hrs & 17.30 hrs..
2. Water Year ranges from 1st June of one calendar year to 31st May of the next calendar year and covers one complete Hydrological cycle.
3. Measuring authority refers to the field division responsible for the collection of Meteorological data.
4. All the Meteorological data viz. Maximum- Minimum temperature, wind velocity, Humidity, and evaporation is published in the form of daily observed data keeping in view of its utility in designing of hydrological, hydropower projects and for agricultural purposes etc.

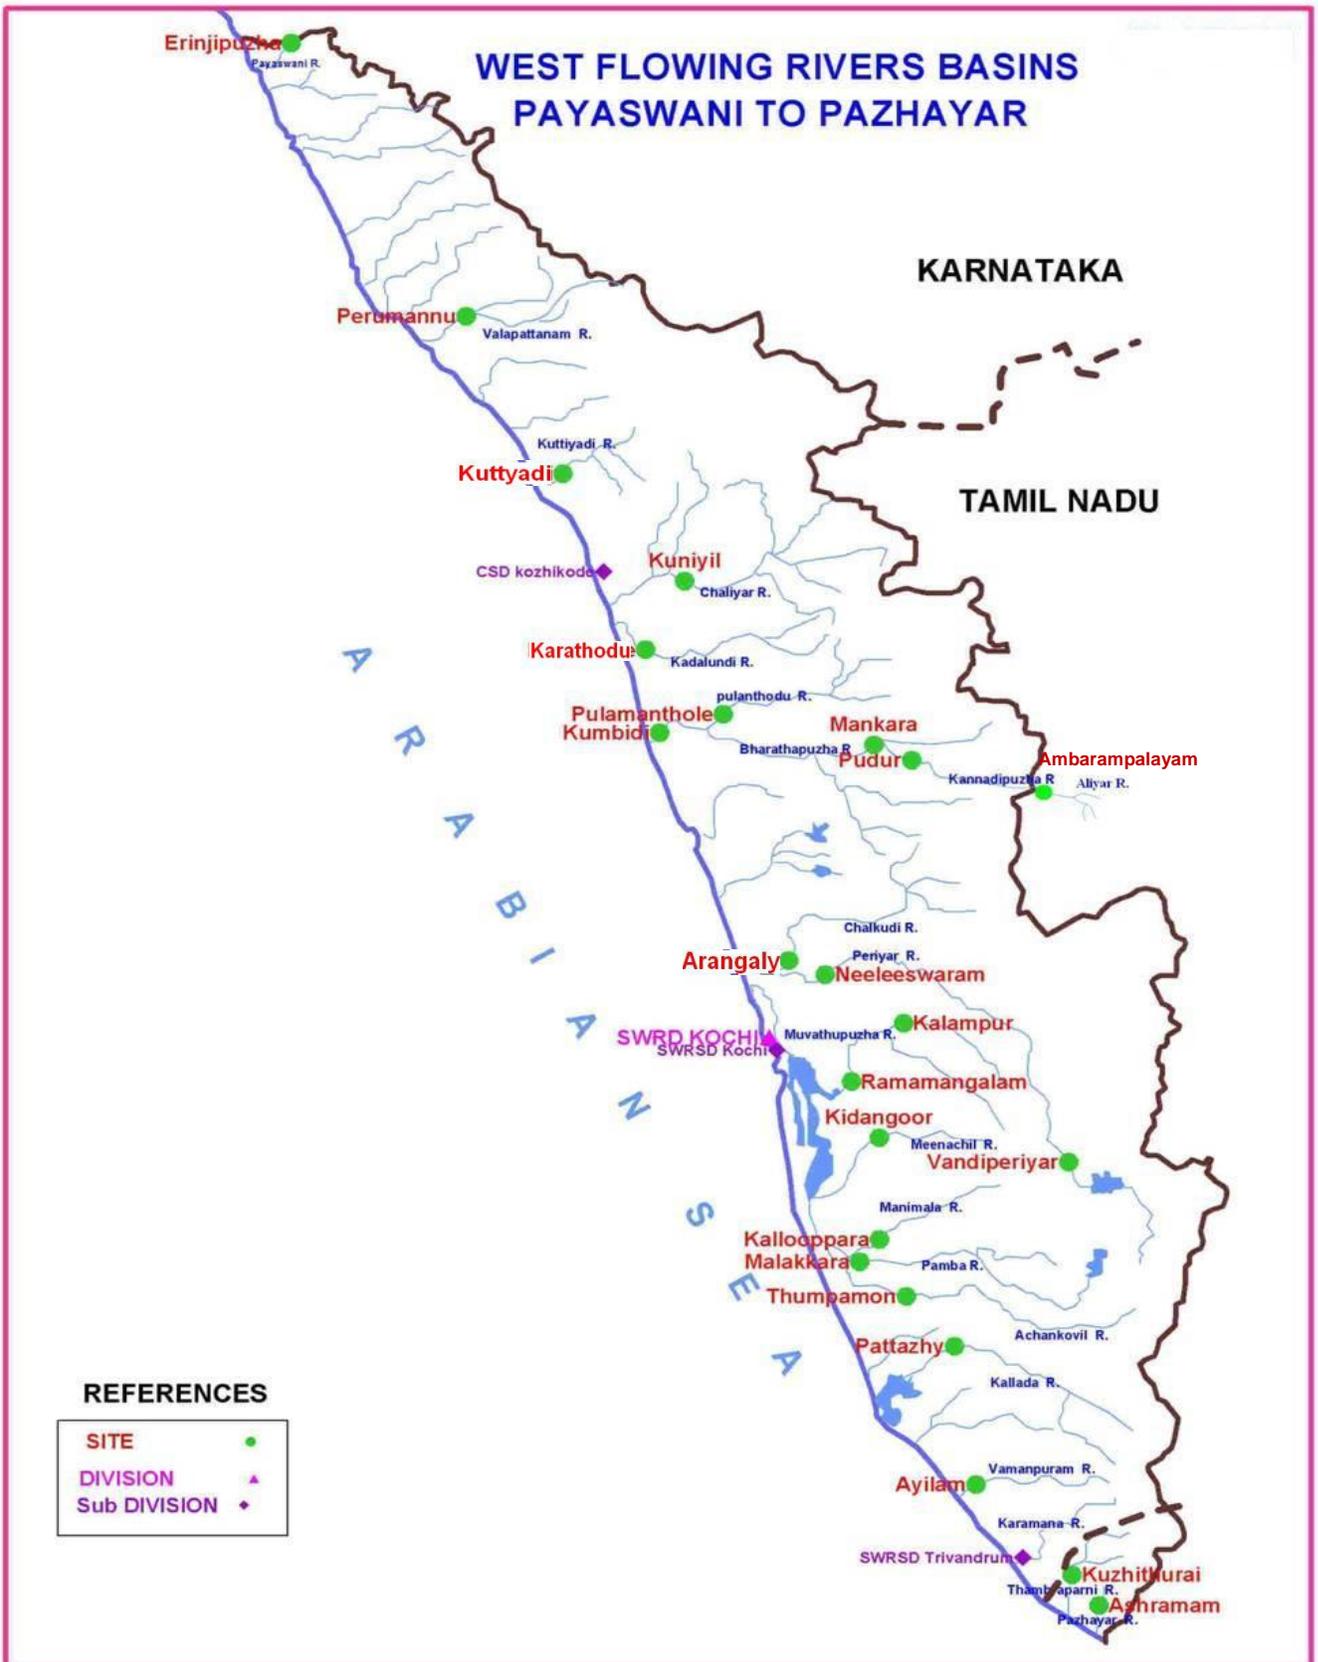

2.2 METHOD OF PRESENTATION

In the succeeding pages, station wise Meteorological data (daily observed) are presented containing Maximum-Minimum temperature, wind velocity, evaporation, Humidity, and Rainfall data.
