

Chapter -1: Tapi Basin

1.1 Introduction

Tapi Division, Surat under Hydrological Observation Circle, CWC, Gandhinagar is conducting hydrological observations in the catchments of Tapi River and its tributaries at 18 stations, out of which nine (9) are under Flood Forecasting scheme, three (3) under National Network scheme and six (6) are under 80 - Key Hydrological Observation scheme.

Basin Map of Tapi River, showing CWC sites is enclosed as **plate-1**

The gauge & discharge data of five (5) stations, viz. Tapi at Burhanpur, Purna at Gopalkheda, Purna at Yerli, Tapi at Gidhade and Tapi at Sarangkheda are included in this book. From administrative consideration, the basin is divided into three zones viz Upper Tapi Zone, Middle Tapi Zone and Lower Tapi Zone each having one Sub-division viz. Upper Tapi Sub-Division, Bhusawal, Middle Tapi Sub-Division, Dhule and Lower Tapi Sub-Division, Surat respectively under the Tapi Division, Surat. Salient features of existing sites in Tapi basin are given in **Table-1**.

1.2 Geographical setting of Tapi Basin

The Tapi Basin is situated in the northern part of the Deccan Plateau and extends over an area of 65145 sqkm which is nearly 2% of the total geographical area of the country. Nearly 80% of the basin lies in the State of Maharashtra. The basin lies between east longitudes of $72^{\circ} 38'$ to $78^{\circ} 17'$ and north latitudes of $20^{\circ} 05'$ to $22^{\circ} 03'$. It is bound in the north by the Satpura range in the east by the Mahadeo hills, in the south by the Ajanta range and Satmala hills and in the west by the Arabian Sea. The river is bound on the three sides by the hill ranges. The Tapi River along with its tributaries flows over the plains of Vidharbha, Khandesh and Gujarat and over large areas in the state of Maharashtra and a small area in Madhya Pradesh and Gujarat.

The basin has an elongated shape with a maximum length of 587 km from east to west and the maximum width of 210 km from north to south. Perimeter of the basin is about 1840 km. The State wise distribution of the drainage area is given in the **table-2**, There are two well defined physical regions, in the basin, viz hilly region and plains; the hilly regions comprising Satpura, Satmalas, Mahadeo, Ajanta and Gawilgarh hills are well forested. The plain covers the Khandesh areas which are broad and fertile suitable for cultivation primarily. The basin consists of black soils; The coastal plains of Gujarat are composed of alluvial clays with a layer of black soil

above. The culturable area of the basin is about 4.29 Mha which is 2.2% of the total culturable area of the country. The forest cover is about 25% of the area in the basin. Physiographically, the area is a basaltic landscape with major physiographic units of plateau lands, escarpments, hills, piedmont plains, colluvio-alluvial plains and valley plains.

The entire Tapi basin can be divided in three sub basins: Upper Tapi Basin up to Hathnur (confluence of Purna with the main Tapi (29,430 sq km), Middle Tapi Basin from Hathnur up to the Sarangkheda gauging site (28,970 sqkm), and the Lower Tapi Basin from Sarangkheda up to Sea (6,745 sq km). The annual rainfall for the upper, middle and lower Tapi basins for an average year is 931.90 mm, 713.05 mm and 1407.9 mm respectively.

Table-1: Salient features of CWC sites of River Tapi at a Glance

1.3 The River System

1.3.1 Tapi River

The Tapi River (Hindi ताप्ती , Marathi तापी, Gujarati: તાપ્તી) ancient original name Tapi River (Sanskrit: तापी), is a river in central India. It is one of the major rivers of peninsular India with a length of around 724 km. The Tapi River originates in the Betul district from a place called Multai. It is one of only three rivers in peninsular India that run from east to west - the others being the Narmada River and the Mahi River. The Tapi is the second largest westward draining inter-state river basin. It covers a large area in the State of Maharashtra besides areas in the states of Madhya Pradesh and Gujarat.

The Tapi River drains an area of 65145 sq km out of which nearly 80 percent lies in Maharashtra. The State wise distribution of the drainage area is shown in **Table 2**.

Table-2: State wise distribution of drainage area

Sl. No	Name of State	Drainage area (sqkm)	Percentage of total
1	Madhya Pradesh	9,804	15.0
2	Maharashtra	51,504	79.1
3	Gujarat	3,837	5.9
Total		65,145	100.0

For the first 282 Km., the river flows in Madhya Pradesh, out of which 54 Km form the common boundary with Maharashtra State. It flows for 228 Km in Maharashtra before entering Gujarat. Traversing a length of 214 Km in Gujarat, the Tapi joins Arabian sea in Gulf of Cambay after flowing past the Surat city. The river receives

tidal influence for a length of about 20 Km upstream from mouth i.e. up to Singanapure weir.

The Tapi receives several tributaries on both banks. There are 14 major tributaries having a length more than 50 Km. On the right bank 4 tributaries namely, the Vaki, the Gomai, the Arunavati and the Aner join the Tapi. On the left bank, 10 important tributaries namely the Nesu, the Arunavati, the Buray, the Panjhra, the Bori, the Girna, the Vaghur, the Purna, the Mona and the Sipna drain into the main channel. The drainage system on the left bank of the Tapi is therefore, more extensive as compared to the right bank area.

The Purna and the Girna, the two important left bank tributaries together account for nearly 45 percent of the total catchment area of the Tapi. The Purna is one of the principal tributaries of the Tapi, starts in Betul district in Gawilgarh hills of the Satpura range and mostly drains through three districts of Vidarbha namely Amravati, Akola and Buldhana. The Girna another Major tributary rises in the Western Ghats and drains Nasik and Jalgaon districts of Maharashtra.

1.3.2 Major Tributaries of the Tapi River System

Purna River

Purna, is one of the tributaries of Tapi, joins from the left. The Purna is the principal affluent of the Tapi. It is the main artery of a network of rivers and streams draining Akola, Amravati and Buldhana districts of Maharashtra and Betul district of Madhya Pradesh. It is the only river in the upper Tapi Basin, which has a perennial flow. Rising in the Gawilgarh hills at an elevation of 900 m., North latitude $21^{\circ} 38' 00''$ and East longitude $77^{\circ} 36' 00''$, the Purna flows first in a South westerly direction for about 60 km through hills and forests before it enters the Purna plains. Flowing in a generally westerly direction for a length of 274 Km, the Purna joins the Tapi north west of Edalabad. The Man is the main left bank tributaries of Purna, and Chandrabhaga and Wan are the principal right bank tributaries. Thus Purna drains a total area of 18, 929 Sq.km.

Girna River

The Girna River is a river in Maharashtra state of southern India. It originates at Kem peak in the Western Ghats range of Nashik District with a latitude of $21^{\circ} 7' 60''$ N and a longitude of $75^{\circ} 19' 0''$ E, and flows east across Nashik and Jalgaon districts, swinging north in Jalgaon District to join the Tapti River. The dams on the river are Chanakapur and Girana Dam. The name Girna derives from the name of Goddess Giraja (Parvati). A 100 sq km area around Girna River has an approximate population

of 979337 (0.009793 persons per square meter) and an average elevation of 246 meters above the sea. The basin of the Girna lies on the Deccan Plateau, and its valley has fertile soils which are intensively farmed.

Gomai

Gomai River is tributary of Tapti River. It originates in Satpura Mountain Range and merge in Tapi River around 2 km east of Prakasha. Gomai river itself has many small tributary rivers like Susri river (passing by Sultanpur), Tipria river (passing by Mandane), Umri river, Sukhi river

Panzara

The Panzara-Kan or Panjhra is a river in Khandesh region of Maharashtra state of India. It is a tributary of the Tapi River. Panjhra River originates just few kilometers from a small town Pimpalner, Tal-Sakri in Dhule District. One small reservoir named Latipada dam is constructed just after its origin.

Pedhi.

The only important left bank tributary of the Purna is the Pedhi. It rises in the low hills near Rithpur and receives a number of small affluent both from the east and the west, the chief on the west being the Naghira river.

Arna.

The first of the principal right bank affluent of the Purna is the Arna which emerges from the Satpuda hills in Betul district and flows in a south and south-easterly direction passing by Sirasgaon to join the Purna just below Deurwada.

1.3.3. Tapi Basin as per the Watershed Atlas of India

As per the watershed atlas of India, Published by Department of Agriculture and cooperation, Ministry of agriculture, Krishi Bhavan New Delhi (1990),

The sub-catchments from 5C1A to 5C5B pertain to Tapi Basin as shown in **plate-3**.

1.3.3.1 Sub-catchment -5C1A (5C1A1 to 5C1A4)

This catchment is situated in the Surat district of Gujarat drained by lower Tapi River near to its confluence with and some small tributary like Ver and Anjana. The catchment area of this sub catchment is 2140 sq.km.

1.3.3.2 Sub-catchment 5C1B (5C1B1 to 5C1B4)

This Catchment is situated in the plain region of Surat and Bharuch District of Gujarat drained by Kim, Sena, Kini and Ghanta River. The total catchment area of this Catchment is 2580 sq.km

1.3.3.3 Sub-catchment -5C2A (5C2A1 to 5C2A7)

This catchment is situated in the hilly and plane region of Gujarat, Maharashtra State and Madhya Pradesh (MP) drained by small tributaries such as Godada nadi, Dadan khadi, Dudhi, khadi, Kanji nadi, Dehli nadi, Vatkaada nadi, Valhari nadi, Vaki, Gomai, Umri, Lendi-Kordi, covered under Bharuch and Surat districts in Gujarat, Dhulia in Maharashtra and Khargone in MP with the catchment area of 3890 sq.km.

1.3.3.4 Sub-catchment 5C2B (5C2B1 to 5C2B7)

This catchment is situated in the hilly and plain region of Maharashtra State and Madhya Pradesh drained by small tributaries such as Arunavati, Aner, Dhudkheda, Guli Bhaurak, Mor and Suki on the Right Bank of Tapi River. The total catchment area of this catchment is 4890 sq.km.

1.3.3.5 Sub-catchment - 5C3A (5C3A1 to 5C3A5)

This is situated in the plain region of Gujarat and Maharashtra State, drained by Main tributaries such as Rangavali, Nesu, Kordi, Shivenad, Bhad and Amravti in Sub-catchment on the Left Bank of Tapi River. The total catchment area of this Catchment is 3200 sq.km.

1.3.3.6 Sub-catchment- 5C3B (5C3B1 to 5C3B8)

This is situated in the plain region of Maharashtra State, drained by Buray, Sur, Pan, Panjhara, Kanehr, Mokti, Hinasan, Jamkheri Kan, Bori Chikli, Sugran and Kanoli covered under Dhulia, Jalgaon and Nasik district and falls in the Subcatchment on the Left Bank of Tapi River. The total catchment area of this catchment is 6480 sq.km.

1.3.3.7 Sub-catchment- 5C3C (5C3C1 to 5C3C9)

This is situated in the plain region of Maharashtra State, drained by Anjani, Girna, Bahula, Tittut, Nanyad, Panjhari, Sukhi, Masam, Kanjari, Aram and Punand in sub-catchment on the Left Bank of Tapi River covered most of the part of Jalgaon Nasik, Aurangabad and Dhulia. The total catchment area of this catchment is 10100 sq.km

1.3.3.8 Sub-catchment-5C3D (5C3D1 to 5C3D4)

This is situated in the plain region of Maharashtra State, drained by Main tributaries such as Vaghursur, Kag, Khadki, Koka and Bhogavati in the sub-catchment on the Left Bank of Tapi River. The total catchment area of this catchment is 2800 sq.km

1.3.2.9 Sub-catchment -5C4A (5C4A1 to 5C3A6)

This sub catchment is situated in the plain region of Maharashtra State, drained by the Tributaries of Purna River such as Nalganga, Biswa, Ghan nadi, Mas, Nirgana and Mun. Catchment area of this sub-catchment is 5950 sq.km.

1.3.3.10 Sub-catchment -5C4B (5C3B1 to 5C3B6)

This sub-catchment is situated in the plain region of Maharashtra State, drained by the Tributaries of Purna River such as Ban, Shahnur and Bodli km. Catchment area of this sub- catchment is 4020 sq.km

1.3.3.11 Sub-catchment -5C4C (5C4C1 to 5C4C6)

This is situated in the plain region of Maharashtra State, drained by the Tributaries of Purna River such as Murna, Purna, Katapurna, Uma and Pedhi Catchment area of this sub-catchment is 5950 sq.km.

1.3.3.12 Sub-catchment -5C4D (5C4D1 to 5C3D4)

This Sub Catchment area is situated in the plain region of Maharashtra State, drained by the Tributaries of Purna River such as Chanrabhaga, Sapna, and Arna. The total catchment area is 3370 sq.km

1.3.3.13 Sub-catchment -5C5A (5C5A1 to 5C5A8)

This Catchment is situated in the plain and hills region of Maharashtra and Madhya Pradesh State, drained by the Bokad river, Mona river, Utaoli, Tapi and Garg. The total catchment area is 4650 sq.km.

1.3.3.14 Sub-catchment - 5C5B (5C5B1 to 5C1B8)

This Catchment is situated in the plain and hills region of Maharashtra and Madhya Pradesh State, drained by Sipna, Kharpra, Dahsana, Khandu, Baki, Betul and Ambora in Sub-catchment. The total catchment area of this sub-catchment is 5980 sq.km.

9	Waghur	Left	751	96	2592	3.98
10	Purna	Left	900	274	18929	29.06
				TOTAL	65145	100

1.4 The Climate

The climate of the Tapi Basin is characterized by a hot summer and general dryness throughout the year except during the south-west monsoon season in the upper and middle part of basin but the lower part of the Tapi River Basin shows variation in temperature, rainfall, humidity and other climatic parameters.

The year may be divided into four periods. The winter from December to February, the summer from March to May, the south-west monsoon season from June to September and the post-monsoon period from the October to November

1.4.1 Temperature

Temperature of Tapi basin is like any other part of central India, the temperature is maximum in the month of May and minimum in the month of December to January. In general, upper and middle part of Tapi basin record lower temperature as compared to the lower Tapi basin where the influence of the sea is prominent, and temperature fluctuation is lower than the upper and middle basin.

The temperature profile in the basin is given in the **table-4**.

1.4.2 Rainfall

The south west monsoon sets in the Tapi basin in the middle of June and withdraws by mid October. About 90 percent of total rainfall is received during the monsoon months, of which 50% is received during July and August. The Tapi River basin shows different climatic characteristics due to the variation of topography from upper to lower part of basin.

The average rainfall in the Tapi basin is 863.5 mm. Basin wise variations of rainfall are shown in **table-5** and average rainfall recorded at various sites is given under **table- 6.**

Table-5: 10 years' Average Monsoon rainfall

Sr. No.	Name of Sub Basin	Bank	Length in Km	Catchment Area (sqkm)	% with reference to total area.	10 years average of Monsoon rainfall (mm) from 2003-2012
1.	Upper Tapi up to Hathnur	Main	290	10471	16.1	961.5
2.	Purna	Left	274	18929	29.1	667.6
3.	Middle Tapi, Hathnur to Ukai excluding Girna.	Main	305	22734	34.9	784.4
4.	Girna	Left	260	10061	15.4	618.5
5.	Lower Tapi-from Ukai to confluence to sea near Surat	Main	129	2920	4.5	1394.8

Table -6: Rainfall at sites in Tapi Basin

Sl No	Name of Site	District	Seasonal Average Rainfall (mm)				Total Annual Average Rainfall
			Winter monsoon	Pre monsoon	South-West monsoon	Post monsoon	
			(Jan-Feb)	(Mar-May)	(June-Sept)	(Oct-Dec)	
1	Teska	Betul (MP)	0.0	0.0	967.9	0.0	967.9
2	Lakhpuri	Akola (MS)	15.7	22.0	640.1	76.9	754.7
3	Chikhaldara	Amarawati (MS)	12.6	28.0	1288.5	106.0	1435.0

1.4.3 Wind

Wind speed profile of the basin, based on data collected, is given in **table-7**. The average monthly wind speed in the Tapi basin varies between about 15 km/h and 1.2 km/h. In the pre and post monsoon period, the wind speed is generally higher. The predominant wind direction is NW followed by SW and W. **Table-7** shows wind data of Tapi basin.

1.4.4 Humidity

The morning relative humidity in the basin varies between 92.4% to 34.6% and the evening relative humidity is between 85.8% to 25.4% depending upon the season. Humidity is maximum during the monsoon months and is around 80% to 90%. In winter months of December and January, relative humidity comes down to around 30%. Variation in relative humidity between upper, middle and lower section of basin is not very pronounced except in the vicinity of coastal areas. The relative humidity at various stations of CWC in the Tapi basin is given in **Table-8**.

1.5 Geology

Trap Rocks

Deccan traps cover maximum part of this basin. These trap rocks are the result of outpouring of enormous lava flows which spread over vast areas of Western, Central and Southern India at the end of mesozoic era. They came through long narrow fissures and cracks in the earth crust and spread out as nearly horizontal sheets. They are called 'plateau basalt', because they form a flat-topped plateau. Due to the step-like or terraced appearance on the slope of hills they are also known as 'trap'. These volcanic rocks assume a considerable thickness ranging from a few hundred feet in the south to a couple of thousand feet in the north. The individual thickness of flow varies from a few feet up to a 100 feet or more. A bore-hole at Bhusawal 1211 feet deep, revealed 29 flows, the average being 40 feet. In the high hills consisting of several flows, the individual flows can easily be demarcated by their distinct flow lines along which a thin growth of grass is noticed. The lavas are generally horizontal in disposition but at places they dip at very small angles. The traps that are commonly found in the plateau or cliff faces are compact and harder, often characterized by vertical prismatic or columnar jointing. They are dark grey or dark greenish grey to brownish grey in color. The amygdaloidal variety, which is greenish to purplish in color and comparatively softer, generally forms the slopes and valley floors. They contain innumerable cavities which are usually filled with secondary minerals such as quartz, chalcedony, agate, jasper, rock crystal, Zeolites and calcite. The ash or Scoriaceous beds and red bole beds are sometimes noticed. The main minerals constituent in the trap rocks are abundant in Labradorite and Enstatite-augite with varying proportion of interstitial glass which on alteration gives rise to secondary minerals like Palagonite, Chlorophane Iddingsite, etc. Sometimes Porphyritic basalt is seen showing Phenocrysts of Felspars and glassy matters. Magnetite occurs as minute discreet grains amidst other minerals as well as in the glassy groundmass. In a few cases, olivine is also present.

The other formations found in the basin are Alluvium, lower Gondwana, Cuddapah system Bijwara series and granites gneiss. Most of the area of Tapi basin falling in the Maharashtra state is full of cuts and valleys, land on the right side of the basin lying on southern slopes of Satpura hills consist of black soils the soil cover is deep and rock is found at greater depths. Lands on the left of the basin on northern slopes of Sahyadri consists mainly of dykes and red Murrum soil and are rocky in most parts.

The stratigraphic sequence of Tapi basin is tabulated **table-9**.

Table-9: Stratigraphic sequence

Formation	Age
Soil, river alluvia, calcareous Kankar and sands, etc.	Recent.
Conglomerates	Sub-recent.
Trap dykes	Cretaceous Eocene
Deccan basalt flows with inter-trappean Beds, ash beds.	
Erosional Unconformity :	
Upper Gondwana sandstones	Lower cretaceous.

Tectonics and Sedimentation in Tapi Basin

The Late Cenozoic period in the Central Indian Tectonic Zone (CITZ) was marked by several episodes of crustal adjustments which are reflected in terms of various tectonic landforms, repeated adjustments in the drainage systems and sedimentation pattern in the Tapi basin which is a half graben structure. The northern margin of the basin is bound by ENE-WSW trending Tapi Fault Zone (TFZ) while the southern margin gradually merges with the Ajanta-Buldhana plateau.

The Tapi in the initial eastern part runs along a narrow intermontane valley carved into the lower middle level plateau of the south Satpuras. The course of the river is dominantly straight to sinuous with resistant channel boundaries and coarse bed material. Here, majority of the fluvial deposition has been in the form of overbank deposits with restricted flood plain development. The river here flows through a fault controlled valley cut into Deccan Traps and the river terraces on either bank are unpaired. The episode of faulting appears to have been preceded by a high rainfall phase and development of ash associated red paleosol horizon. Post uplift sedimentation in this part of the basin has been in form of buff coloured slack water deposits, dominantly finer grained during uppermost part of Late Pleistocene. Possible inset of transient arid phase (~LGM) had led to preservation of lithified grit beds. The last phase of sedimentation in this part of the basin is in form of grey silt bearing inset terraces of Holocene period derived

from older sediments. This phase appears to have witnessed a major episode of faulting as evident by presence of massive, meter scale bank collapse structures in the sediments. At present the river has set into a denudational phase, engaging into deep incision of its older sediment package and intense undercutting of the exposed sections. Intense vertical erosive activity influenced by slow tectonic uplift is manifest in form of fresh scarp sections, presence of giant pot holes and talus scree and block falls from the sections along the river course. The imprints of ongoing tectonic activity in this part have been in the form of tilting, crushing and brecciation of Deccan Traps and alignment of hot and cold springs along the river course.

The Tapi River after traversing this intermontane valley descends onto the foothills which has a different set up of tectonic landforms and sedimentation history. Here the river course is having dominantly wide and open meander bends with occasional presence of point bars and channel bars. This part represents the deeper part of the basin and sedimentation here has been under the influence of two regional scale faults: Tapi North Fault (TNF) traversing the lower plateau parts of the Satpura ranges and its margin and Tapi River Fault (TRF) which as the name suggests, runs along the course of the Tapi river and has governed the sedimentation pattern in the basin. Several first order transverse tributaries emerge from the Satpura foothills and join the Tapi River course in this stretch. Chronological data supports that the sedimentation in this part of the basin was initiated at least during middle Pleistocene. Episodic uplift of the reactivated segments of old crustal scale discontinuities has provided loci for sedimentation in the basin. The flood plain (red palaeosol) sediments of this part also show signatures of high rainfall phase caused by intensification of monsoon and episodic uplift of the northern footwall block of TNF. Climatic amelioration caused development of multiple bedded calcrete horizons and flash flood deposit. Rejuvenation of the main river and its tributaries has also introduced channel deposits along the river courses at a later phase possibly during upper part of Late Pleistocene. The youngest Holocene deposit occur as inset terraces along the river course. The sedimentary pile in this part is appreciably thick and the base rock/Quaternary contact is not seen along the river course except for the parts which have witnessed contemporary uplift along TRF.

Both TNF and TRF have been active during the deposition of sediments in this part of the basin. The imprints of TNF activity have been in the form of zones of high

geothermal gradient, accelerated denudation even along the juvenile first order streams and deformation of sediments. TRF on the other hand, has preserved the evidences of active tectonic activity in the form of paleoliquefaction features, deformation of sediments, development of coalesced colonies of potholes resulting from intense scouring of the Deccan Trap base rock along the uplifted segments of the TRF and development of alluvial fans. The episodic faulting in the basin created the depocentre for initiation of sedimentation and seismicity in the basin.

(Source: Snigdha Ghatak, Mriganka Ghatak, *Tectono-climatic controls on fluvial sedimentation of upper and middle reaches of Tapi River basin, Central India*, 2011, Second National Working Group Meeting, Geological Survey Of India)

Purna Basin

Part of the basin is covered by rocks of the Deccan volcanics of Creteceo-Eocene age, and a few alluvium patches of the Purna and Penganga basin, respectively. The trap rocks are usually fine to coarse-grained, dark grey to greenish-black basalts of vesicular and massive types. The hard compact massive flows are generally noticed on the hill tops, e.g., Melghat section whereas comparatively soft and amygdular varieties usually occupy the flanks of the hill or valley floors. Spheroidal exfoliation is a characteristic feature of weathering in the traps. Besides vertical and inclined jointing, columnar jointing is also well seen in more massive types. The vesicular and non-vesicular flows are at places separated by thin beds of ash or scoriae, but typical inter-trappean sedimentary rocks have not been recognised in the area. The amygdular varieties of flows carry secondary minerals like zeolites (mostly heulandite), calcite and chalcedony. No dykes have been found associated with the trap flows in the district where a lava pile of approximately 800 metres is preserved.

Alluvium

The Purna valley alluvium occupies an extensive stretch of low lying ground between Paturda and the confluence of Purna river with that of Tapi in Jalgaon district. In the river valleys and where superficial rain-wash has accumulated, a mixture of black cotton soil associated with sub-recent conglomeratic formation or light brown laterite material is noticeable at places, but otherwise, there is little variation in the nature and extent of soil or any variety of geological interest. The alluvium of the plains is usually of considerable depth. Much on the alluvium produces effervescence of sodium salts. Majority of the wells sunk in the area have brackish water.

Source : Cultural.maharashtra.gov.in/english/gazetteer

1.6 Soil

The soil in the Tapi basin up to Ukai Dam can be broadly classified in to three groups.

1. Coarse shallow soils
2. Medium black soils
3. Deep black soils.

The area covered by these three group of soils in the basin is given in **table-10**.

Table-10: Types of Soil in Tapi basin

sl. no.	Type of soil	Districts covered
1	Coarse shallow soils	Betul, Khandwa, Khargon, Amrawati, Akola, Buldhana, Jalgaon, Dhule, Aurangabad and Nasik
2	Medium black soils	Khandwa, Amrawati, Akola, Buldhana, Jalgaon, Dhule, and Nasik
3	Deep black soils.	Amrawati, Akola, Buldhana, Jalgaon, Dhule, Nasik, Surat and Bharuch

Coarse shallow soils

These soils have developed primarily from the basaltic Deccan trap and have been considerably affected by natural processes of weathering and erosion. Their depth is generally between 25cm to 50 cm and seldom more, their texture from surface to sub surface varies from silty loam to clay. Their organic matter content is usually poor and they are moderately drained.

Medium black soils

These soils have developed from Deccan traps and cover the largest area of the basin. Their depth is generally between 50cm to 1m. these soils contain higher lime reserve and are alkaline in reaction. These soils are fair in their contents of phosphates and potash but low in organic matter and nitrogen.

Deep black soils

These soils are found along the Purna river and in the middle and lower reaches of Tapi River. These soils have originated primarily from decomposition of trap rocks of hilly ranges. The depth of this soil varies from 1m to 6m. The soil have very high clay content Montmorillonite predominating and not easily workable during monsoon. The soil reaction varies from neutral to alkaline.

1.7 Forest

The Tapi basin exhibits two distinct geographical regions, viz., the plain regions in the east and south-east and the hilly regions of the Satpura ranges in north and north-west. The plain region is extensively cultivated and forests appear only in dotted, scattered patches. The hilly region is an extensive block of compact forests and contains an abundance of rich teak trees. The percentage of the forest area to total area in the Tapi basin is approximately 25% of the total area, and is unevenly distributed.

Tree Forests

These include the forests of producing big-size teak and timber of other type.

Minor Forests

These include the forests in the plain regions, which are capable of producing small-size timber poles of teak, etc. These forests also supply fire-wood, thorns and grass and serve as good pastures for grazing the cattle.

Babul Bans.

These are artificially created forests of Babul (*Acacia arabica*) in the cultivated plain tracts and lie dotted over the area.

Ramnas and Pasture Forests

These include open forests with sparse tree growth and lie mostly in the plain regions, where an intense demand exists for grass and grazing.

Utilization

The forests are managed under regular working plans, the object being the supply of large-size timber for commercial use. The minor forests like Babul Bans and the Ramnas and pasture lands are being maintained to supply the local demand for small-size timber, fuel, grass and grazing.

Forest Produce

The major forest produce is timber. The minor forest produce constitutes various items, such as bamboo, fuel, Rosha grass, fodder grass, minerals, horns and hides, Tendu leaves and gum.

Forest Trees

The most useful trees and plants found in these forests, are given below: -

Teak (Tectona grandis), Tiwas (Ougenia dalbergioides), Shisham (Dalbergia latifolia), Bija (Pterocarpus marsupium), Haldu (Adina cordifolia), Saj (Terminalia tomentosa), Dhawda (Anogeissus latifolia), Dhaman (Grewia tiliacefolia), Semal (Bombax malabaricum; Silk cotton tree), Sivan (Gmelina arborea), Kusum (Schleichera trijuga), Kalam (Stephogyne parvifolia), Kahu (Terminalia arjuna), Landia (Lagerstroemia parviflora), Harra (Terminalia chebula), Bhormal (Hymenodictyon excelsum), Salai (Boswellia serrata), Moyen (Odina nodier), Kekda (Garuga pinnata), Maharukh (Ailanthus excelsa), Moha (Madhuca latifolia), Tendu (Diospyros melanoxylon)

Achar (Buchanania lanza), Aonla (Emblica officinalis) Beheda (Terminalia bellerica), Bhilawa (Semecarpus anacardium) Amba (Mangifera indica) Bor (Zizyphus jujuba) Palas (Butea frondosa) Babul (Acacia arabica) Khair (Acacia calechu), Anjan (Hardwickia binata), Jamun (Eugenia jambolana), Bhosa (Bauhinia racemosa), Rohan (Soymida febrifuga), Amalatas (Cassia fistula), Bel (Aegle marmelos), Kumbhi (Careya arborea), Gular (Ficus species), Dahi-palas (Cordias), Mokha (Schrebera swietenioides), Bhirra (Chloroxylon swietenia), Hiwar (Acacia leucophloea), Kulu (Sterculia urens), Gongal (Cochlospermum gossypium) Dudhi (Wrightia tinctoria), Arang (Kydia calycina) Pangra (Exythrina Indica), Bamboos (Dendrocalamus strictus).

1.9 Important Projects in Tapi Basin

The salient features of the important projects, namely Hathnur Dam of Upper Tapi Project, Kakrapar weir and Ukai Dam of Ukai Project, Girna Dam and Dahigaon Weir of Girna Project, are as follows:

1.9.1 Hathnur Dam (Maharashtra)

This is the first stage of Upper Tapi Project. It consists of 717 m long Ogee shaped gated overflow weir in the centre with 1863 m long earthen embankment on either side constructed across the river Tapi near Hathnur village in Jalgaon district of Maharashtra State. It is having a live storage capacity of 255 MCM to irrigate 3,78, 384 hectares of land in Raver, Yawal and Chopda talukas of Jalgaon district by a right bank canal of 95 km length.

1.9.2 Kakrapar Weir (Gujarat)

The project comprises of an Ogee shaped masonry pick up weir constructed across the Tapi River near Kakrapar in Surat district of Gujarat. The weir was constructed at a cost of Rs.20.61 crores. The weir is 621 m long and 14m high. Two canals take off from either bank to irrigate an area of 2.28 lakh ha. This project was commissioned in the year 1954 as stage -- I of the Ukai project.

1.9.3 Ukai Dam (Gujarat)

This is stage - II of the multipurpose Ukai Project. It consists of 4928 m long and 68.6 m high composite earth - cum - masonry dam across the Tapi River near Ukai village in Surat district of Gujarat State. It includes a spillway with power dam constructed on the left bank. Two canals take off from either bank to irrigate an

area of 1.58 lakh ha. The power house has an installed capacity of 4 units of 75 MW each.

1.9.4 Girna Dam (Maharashtra)

It is constructed across river Girna, a tributary of river Tapi near Panzan village in Nandgaon taluka of Nasik district. This is a multipurpose scheme, main purpose being irrigation and subsidiary power generation (power generation yet to be started). This is a composite dam having total length of 963.17 m, masonry dam with gated spillway for a length of 426.72 m and earthen dam of length of 536.45 m respectively.

1.9.5 Dahigam Weir (Maharashtra)

It is constructed across river Girna near Dahigaon village in Pachora Taluka of Jalgaon district of Maharashtra. It consists of a Ogee shaped Weir having a length of 422.76m and a maximum height of 8.82m. It irrigates an area of 57797 ha land through left bank canal of 45.06 Km. length.

Chapter-2: Stream flow Data

2.1 Methodology

Gauge Measurement

Water level or stage of the river is measured as its elevation above the G.T.S. datum. Water level measurement is conducted by reading non - recording gauges as specified in IS: 4080-1967. Series of vertical staff gauges have been fixed at three sections at every Site. The gauge posts are generally of wood or concrete with cut at water face arrangements and fixed securely in vertical position by anchoring them in M - 150 concrete base of suitable size. Enamelled vertical gauge plates with metric markings are fixed on the gauge posts so that gauges can be read to an accuracy of 0.005 m.

Out of three gauge lines the central one is used as Station Gauge line and the readings of other two lines are used for calculation of water surface slope. During non-monsoon season gauges are read thrice daily (0800, 1300 and 1800 hrs.) and during monsoon gauges are read hourly, at the station gauge line.

Discharge Observation

Discharges are observed once a day starting from 0800 hours at all the sites by area - velocity method, except on Sundays and holidays. For non-observation days, the discharges are computed from the stage and discharge relation prepared, from the observed data for that water year.

The stream width is divided into 15 to 25 segments based on the degree of accuracy as outlined in IS: 1192-1981. The width of the river is measured by steel metallic tape or wire/ nylon rope stretched across the river width with markings indicated thereon when the river width and depth permitted wading. For large width and deep flow conditions segmentation is done using simple trigonometric method for which pivot point and segment blocks have been constructed at each site.

The depth is measured by using sounding rod 3 to 6 metres long adopting specifications given in IS: 3912-1966. When the river flow is very deep and swift, lead lines / echo sounders are used. Necessary Air and Wet line corrections are made to the sounding observations as provided in IS: 1192-1981. The velocity is measured as per IS: 3918 - 1966 by using a cup type current meter conforming to specifications given in IS: 3910-1966.

The current meter is lowered at the requisite depth (0.6d) in a vertical at every segment by suspension equipment as specified in IS: 6064-1971.

In high velocities, boats fitted with power engines or motor launches are used. Drift is measured and corrections for the same are made. Where observations by boat or launch are not possible, measurement of velocity is conducted from bridge or cable way. When the above procedures are not possible then velocity is measured by float observations. The observations are recorded in a standard format for calculation of total river flow.

Equipment used for observation

Table-14: List of equipment used in observation

Sl. No	Name of Equipment	By Wading	By Bridge	By Boat	By Float
1	Current Meter	✓	✓	✓	X
2	Pigmy Current Meter	✓	X	X	X

Morphology: No significant morphological changes have been observed at sites.

Narrative description /special information on hydrological conditions is as Under

- a) SRRG information for important G and D sites during flood period: - One Self recording rain gauge and one Ordinary rain gauge are available at sites.
- b) Flood Hydrograph details enclosed in data part.
- c) Extent of flooding:- No unprecedented flood experienced during 2012-13
- d) Breaching of embankments and other structures, if any: - There had been no incident of major breaches during 2012-13

- e) Substantial changes in river morphology: - Study of river cross sections of last few years indicates that there is no appreciable change in the river morphology at sites.
- f) Drought / Water scarcity: - Water scarcity is not experienced and hence no drought in this zone.

2.2 Data Availability of Existing Sites

2.3 Explanatory notes

The explanatory notes given here-under are designed to assist in the interpretation of hydrological parameters contained in the data presented. The notes are, therefore, applicable in so far as the data presented in this book.

- i] Water year covers the period from June 1st of the one calendar year to May 31st of the next calendar year and includes one complete hydrological cycle.
- ii] Discharge is given in cubic metre per second.
- iii] Discharges given are observed daily discharges.
- iv] Discharges are expressed as 0.000 when river bed is dry and also when there is stagnation of water i.e. velocity is observed as NIL.
- v] Discharges indicated with asterisk (*) mark are Estimated discharges as per rating curve equation corresponding to stage at 0800 hours of that day. Discharges indicated with (#) marks are estimated discharges of the discarded points.
- vi] The Zero of Gauge is a datum level / R. L. fixed for a given site, which is kept 1 or 2 m lower than the lowest water level recorded in a perennial stream. In a non- perennial stream, it is kept 1 or 2 m lower than the lowest bed level of the stream.
- Vii] Discharges are rounded off to:
 - a] Nearest full integer when more than 1000.
 - b] Nearest first decimal figures when between 100 and 1000
 - c] Nearest two decimal figures when between 10 and 100
 - d] Nearest three decimal figures when less than 10.
- Viii] Maximum and minimum discharges are taken from the observed daily flows.
- ix] Runoff in mm is the notional depth of water in millimetres over the catchment area equivalent to annual runoff calculated at the discharge measurement station. It is computed using the relation

$$\text{Runoff (mm)} = \frac{\text{Annual runoff (mm}^3\text{)}}{\text{Catchment area (km}^2\text{)}} \times 1000$$

- x] Peak and lowest flow correspond to the highest and lowest water levels recorded during the period of record.
- xi] Measuring authority refers to the field division responsible for the operation of the gauging station.
- xii] The gauging station code number is a unique NINE digit number, which facilitates storage and retrieval of flow data in data banks. The first two digits are identifier of measuring authority, third and fourth digits represent Basin / Zone and fifth and sixth digit refer to independent river Basins in the zone, seven eight and nine digits indicate site numbers.
- xiii] The month and the year from which data available in the data banks is indicated against record available

Peak Computed Discharge = 195.4 cumecs on 23/09/2012

Corres. Water Level :239.31 m

Lowest Computed Discharge = 0.490 cumecs on 01/07/2012

Corres. Water Level :236.29 m

Note: 01/ to 03/06/12 river in pooling Condition, River dry from 4/6 to 17/06/12, River in polling condition / negligible flow condition, submergence effect of temporary bund at 80m D/S of S/G line from 26/11/2012 to 31/01/2013 .
Q: observed/ computed discharge in Cumec, WL: Corresponding Mean Water Level (msl) in m, *: Computed Discharge #Discarded and estimated

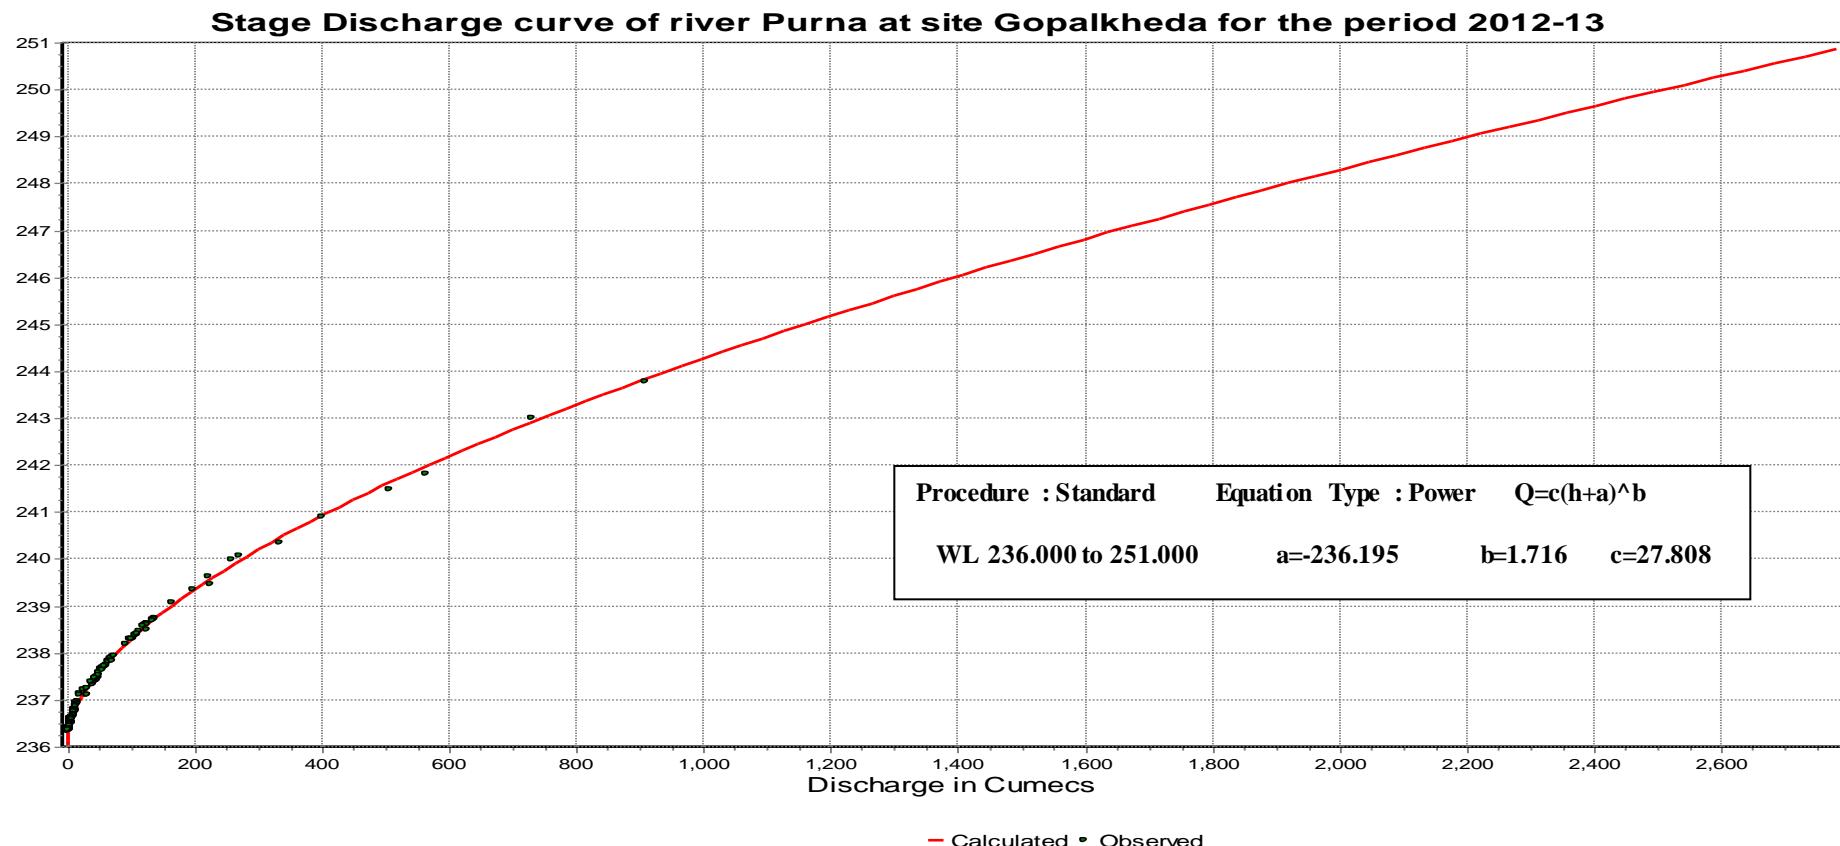

3.2.4 Stage Discharge Curve

Station Name: Purna at Gopalkheda (01 02 17 004)

Division : Tapi Division Surat

Local River: Purna

Sub Division: Upper Tapi Bhusawal

3.2.5

Annual runoff

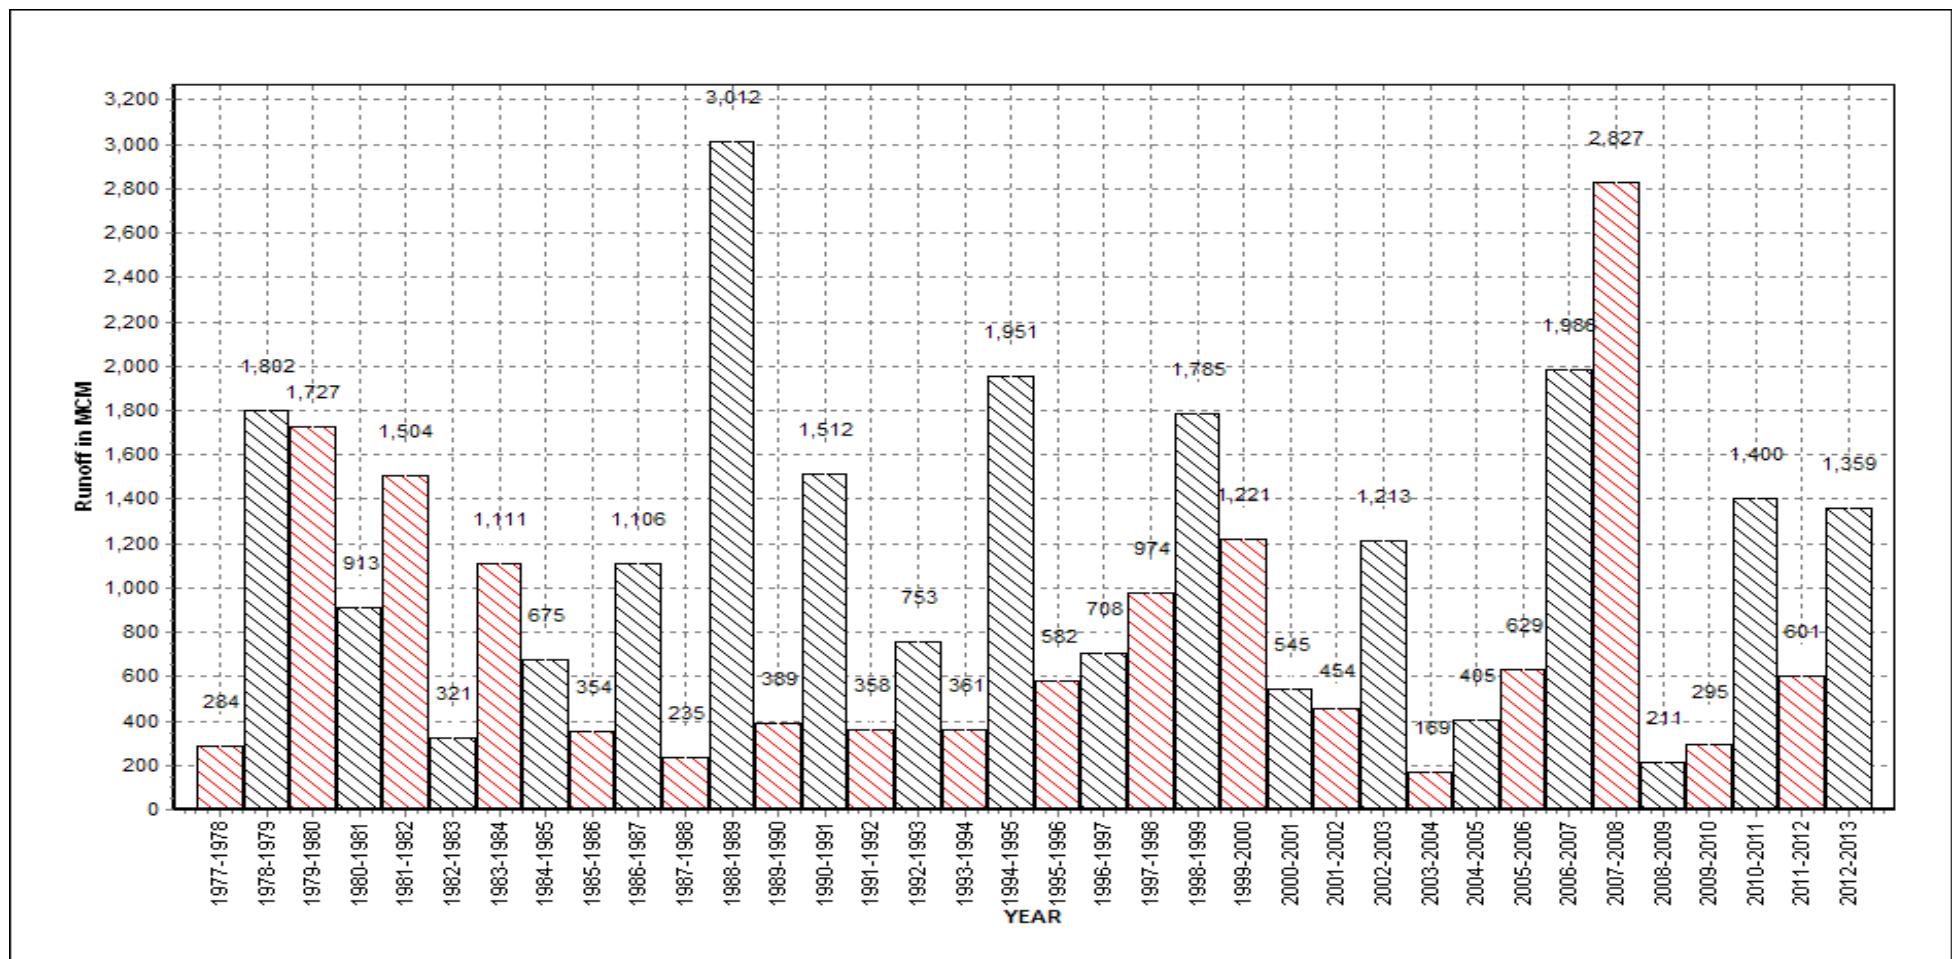

Annual Runoff for the period 1977-2013

Station Name: Purna at Gopalkheda (01 02 17 004)

Division : Tapi Division Surat

Local River: Purna

Sub Division: Upper Tapi Bhusawal

3.2.6 Monthly average Runoff

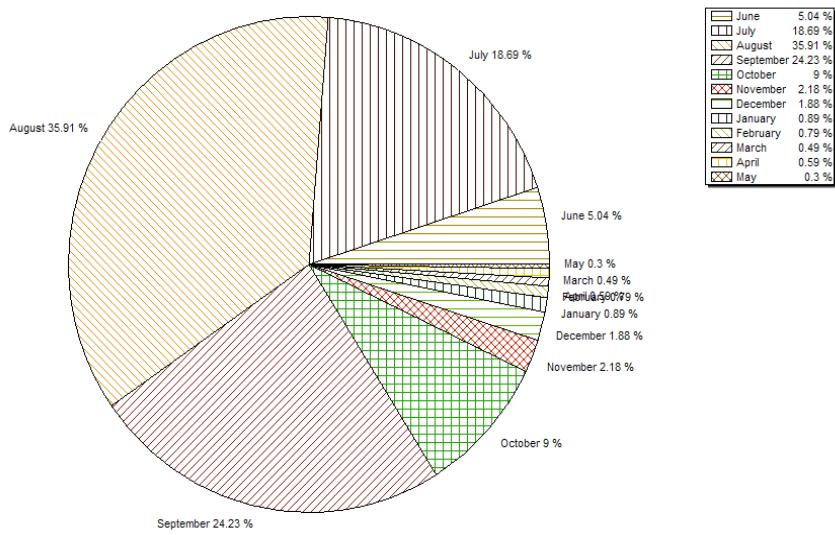

Station Name: Purna at Gopalkheda (01 02 17 004)

Division : Tapi Division Surat

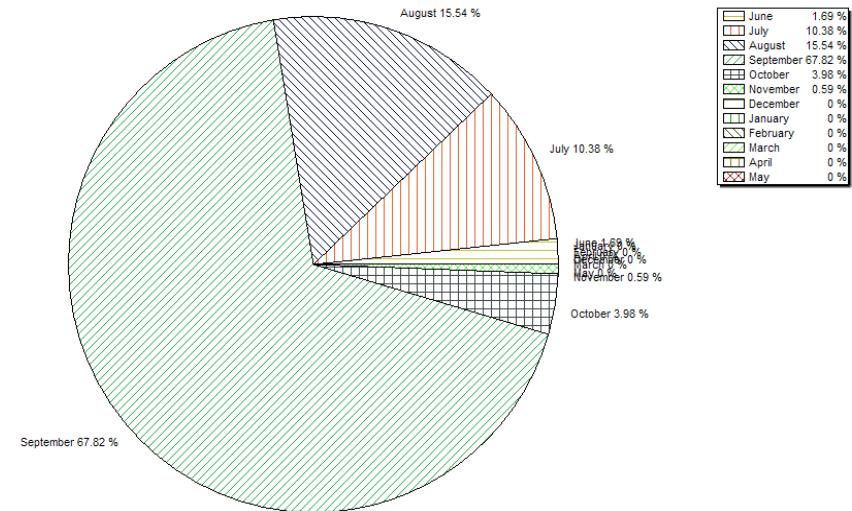

Local River: Purna

Sub Division: Upper Tapi Bhusawal

Monthly Average Runoff Based on period 1977-2013

Monthly Runoff Based on period 2012-2013

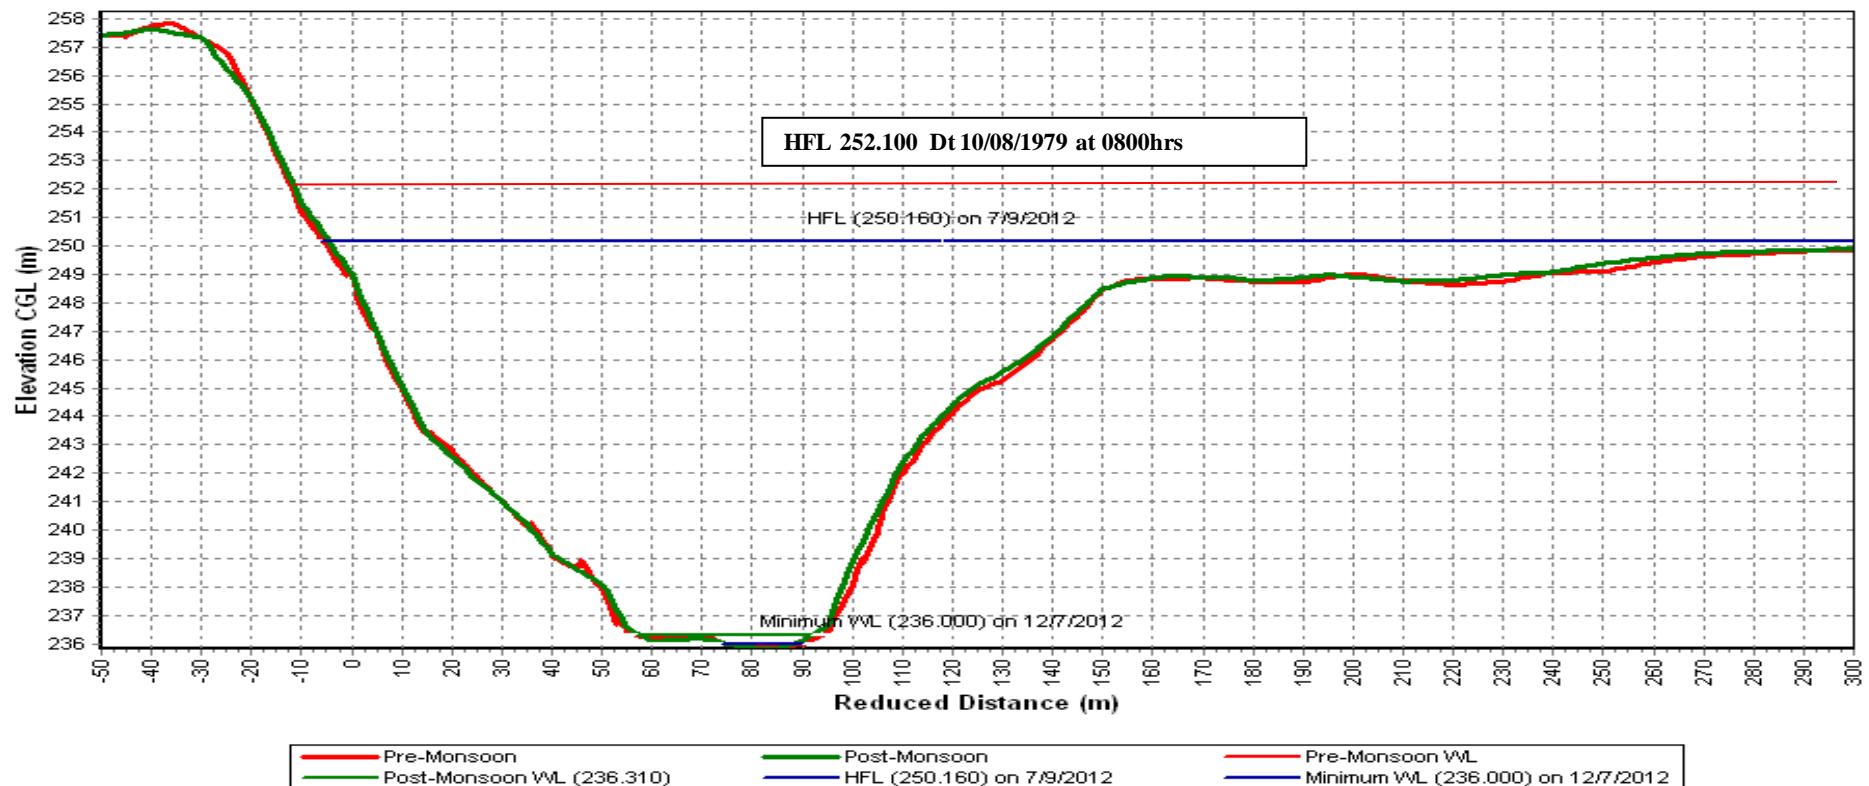

3.2.7 Superimposed cross section

Station Name: Purna at Gopalkheda (01 02 17 004)

Division : Tapi Division Surat

Local River: Purna

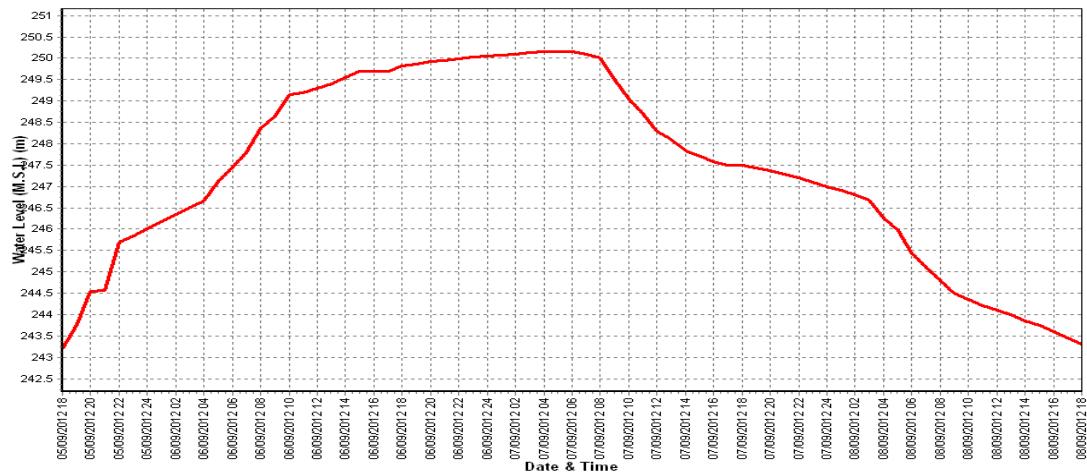

Sub Division: Upper Tapi Bhusawal

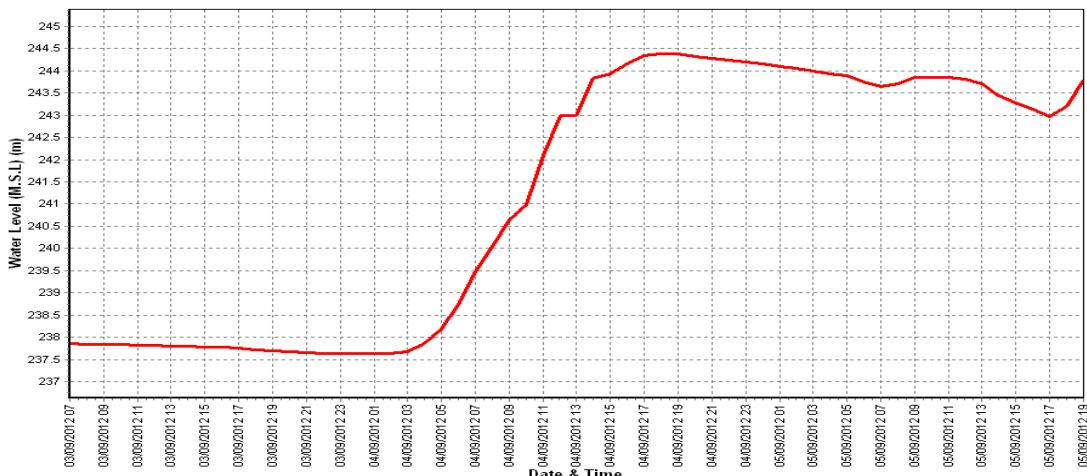

3.2.8 WL vs Time graph of highest I, II, III peak

Station Name: Purna at Gopalkheda (01 02 17 004) Division : Tapi Division Surat
 Local River: Purna Sub Division: Upper Tapi Bhusawal

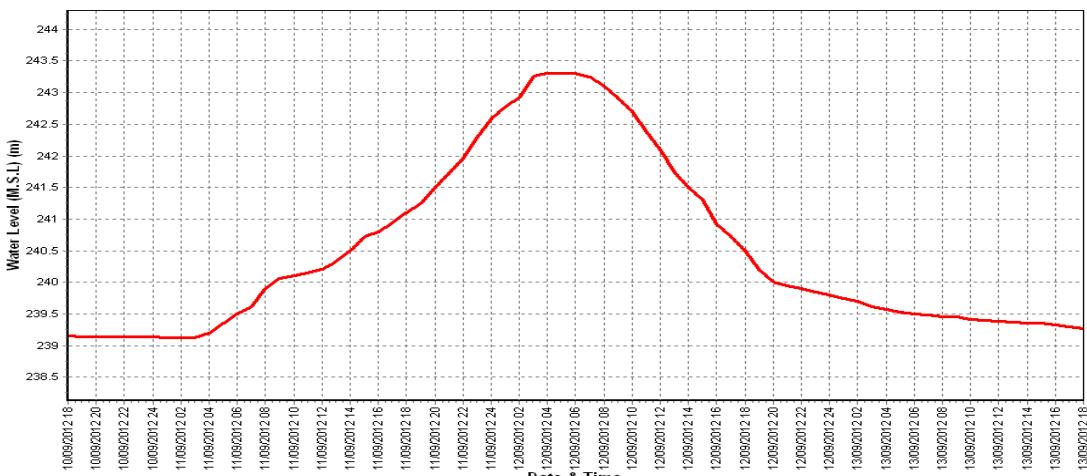

Water level vs Time Graph of Highest (I) flood peak during the water year 2012-13

Water level vs Time Graph of Highest (II) flood peak during the water year 2012-13

Water level vs Time Graph of Highest (III) flood peak during the water year 2012-13

Monthly Average Runoff Based on period 1991-2013

Monthly Runoff Based on period 2012-2013

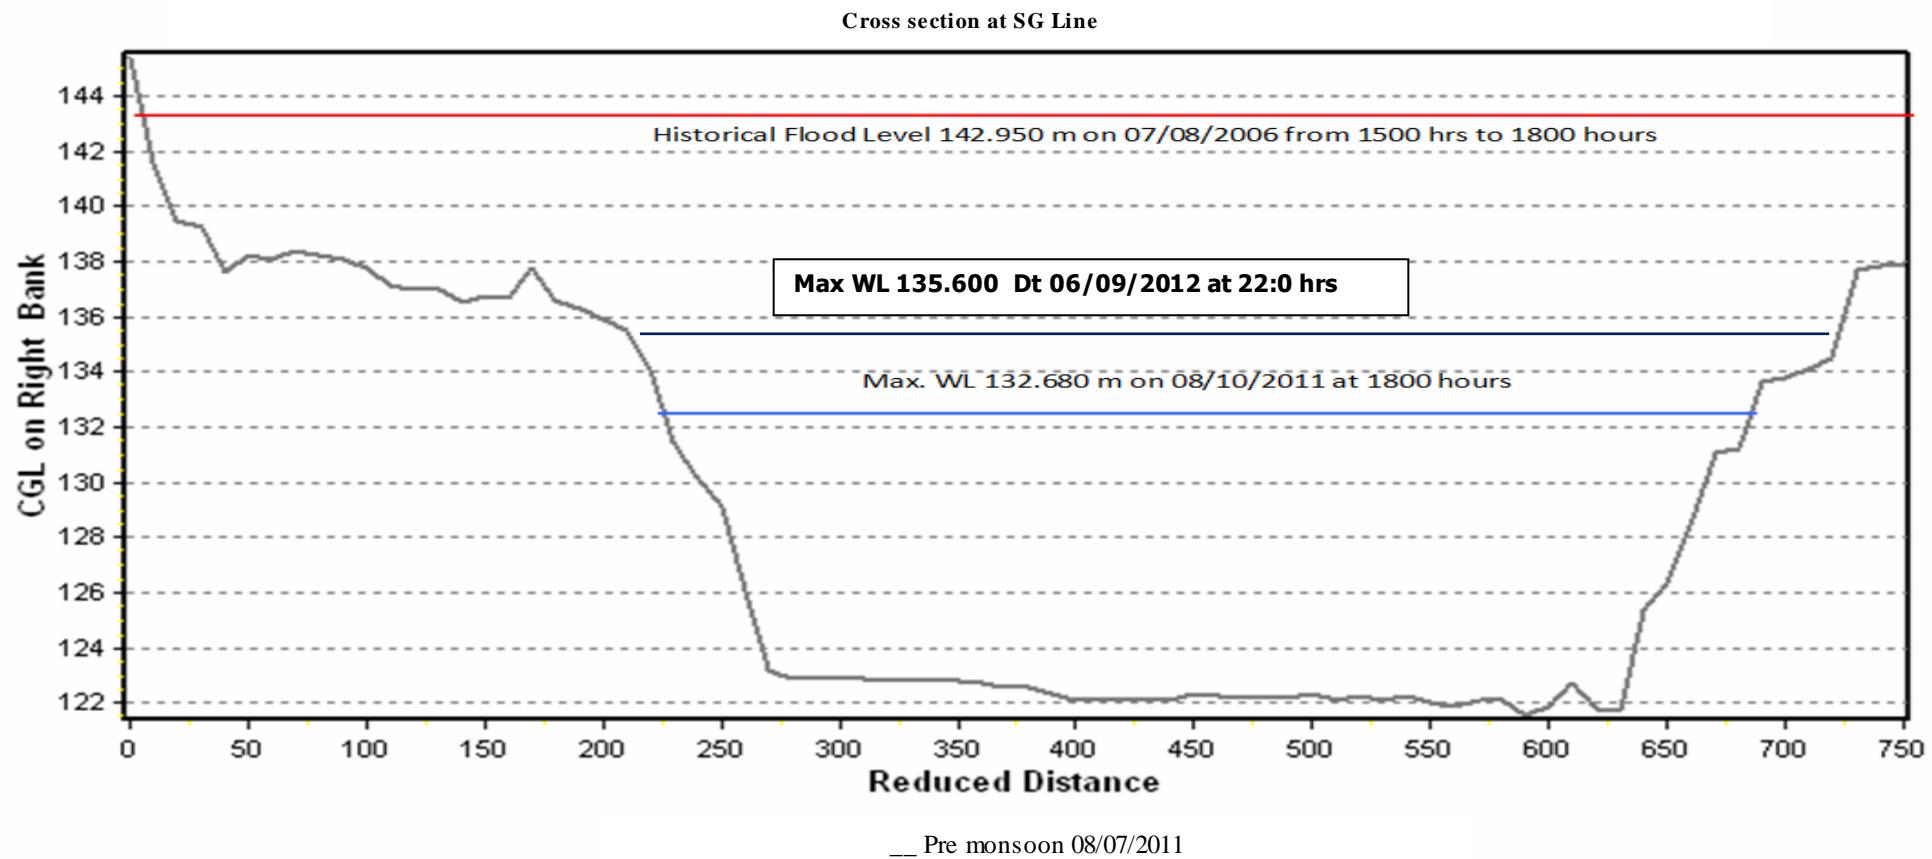

3.4.7

Superimposed cross section

Station Name: Tapi at Gidhade (01 02 17 014)

Division: Tapi Division, Surat Local River:Tapi

Sub Division: Middle Tapi, Dhule

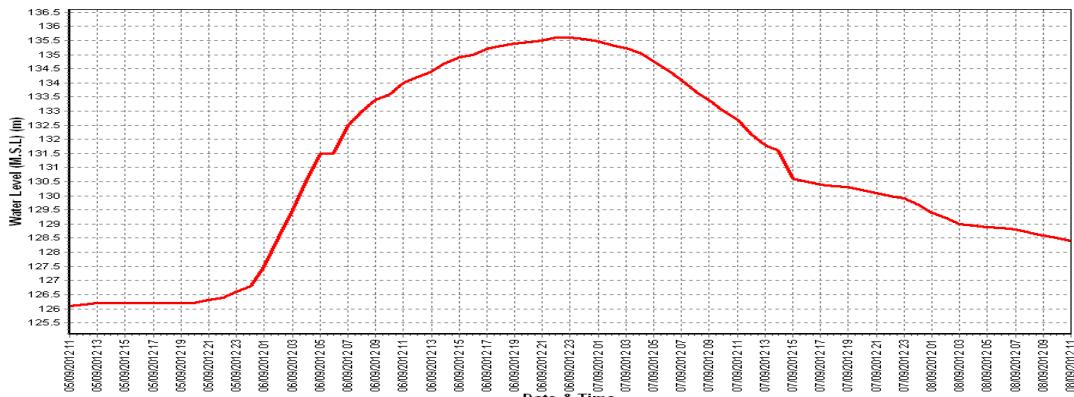

Pre and post monsoon cross section at site have not been taken due to submergence of SG line (Due to storage in Sulwade barrage)

3.4.8 WL vs Time Graph of I,II,III peak

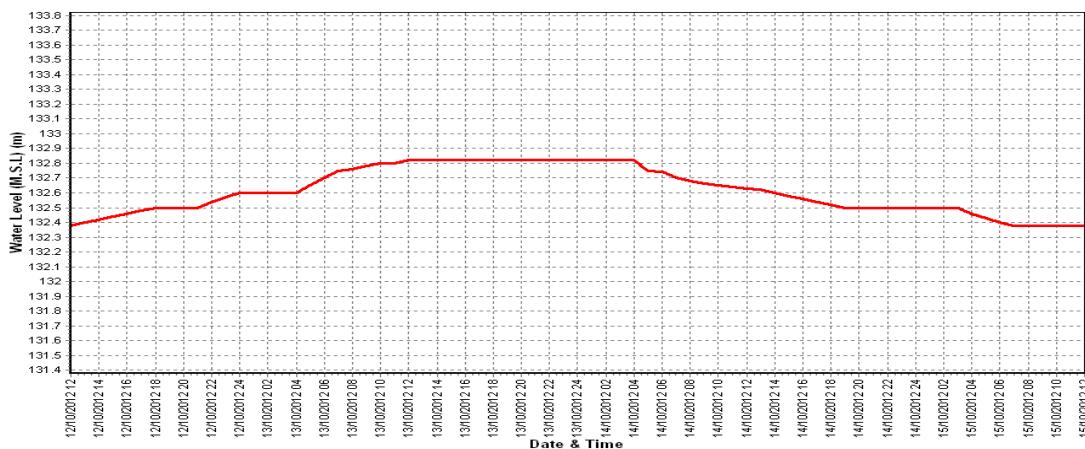

Station Name: Tapi at Gidhade (01 02 17 014)
 Local River:Tapi

Division: Tapi Division Surat
 Sub Division: Middle Tapi Sub Division Dhule

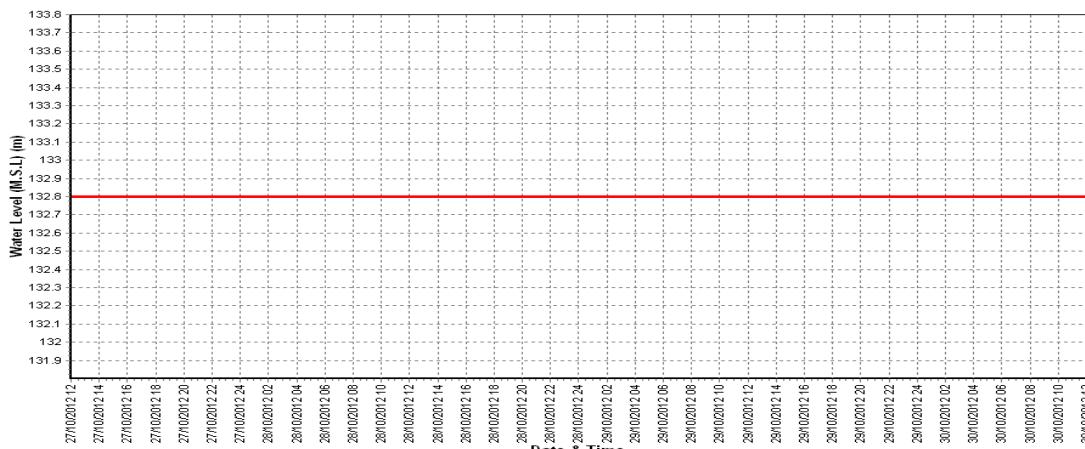

Water level vs Time Graph of Highest (I) flood peak during the water year 2012-13

Water level vs Time Graph of Highest (II) flood peak during the water year 2012-13

Water level vs Time Graph of Highest (III) flood peak during the water year 2012-13

3.5 Sarangkheda

Annual Runoff in MCM = 8298

Annual Runoff in mm = 142

Peak Observed Discharge = 10481 cumecs on 07/09/2012

Corres. Water Level :120.35 m

Lowest Observed Discharge = 0.000 cumecs on 01/06/2012

Corres. Water Level :110 m

All Gates of Barrage closed river in pooling condition from 01-06-12 to 04-07-12, Negligible flow polling condition on 06/7/2012 & 07/07 /2012 and Negligible flow polling condition 16/7/2012 & 21/7/12 to 23/7/2012.Gate closed negligible flow on 26/9/2012 to 28/9 /2012 and Negligible flow All gates closed Negligible flow from 30-9-12

Chapter-4: Trend Analysis

4.1 Introduction

Trends are important indicators of the temporal variability of runoff as computed from observed discharge at site. By analyzing the time sequence of the runoff, we assess the magnitude and significance of the temporal variability. The present surface runoff trend study involves analysis of the temporal variability of data sets on the observed discharges in Tapi basin using available data of existing river gauging stations.

4.2 Methodology

In the analysis of the trends of runoff on Tapi River and its major tributary Purna, annual runoff is computed and analysed. The analysis is carried out for five (5) river gauging stations with sufficiently long and continuous data sets that are fairly representatively distributed across Tapi river Basin.

Overall five stations have been considered in this study. The length of the data sets of river gauging station varies from 22 to 40 years. Subsequently, time series are analysed on various statistical parameters, fitting of mathematical equations, observing moving means for various period so as to find out if there are any trends in the annual runoff data.

4.2.1 Time series analysis

Time series is defined as a sequence of values arrayed in order of their occurrence which can be characterized by statistical properties. Time series analysis may be used to test the variability, homogeneity and trend of a stream flow series or simply to give an upright list the characteristics of the series as graphically displayed. Significant movements of time series are the secular, periodic, cyclic and irregular trends. A time series may display a tendency to increase or decrease, over a specified period. Such a series provides an interesting illustration because if the trend is usually predominant, virtually no other movements are discernible.

Various methods exist for analysis of time series such moving averages, residual series, residual mass curves and balance. Trends may also be revealed by determining if observed stream flow follows some mathematical equation as a function of time.

In this chapter, first statistical parameters have been computed for time series data of annual runoff at different sites in Tapi basin. It is also ascertained if

any mathematical equation can be fitted to the time series to assess predictability. Finally, the data is analysed by the method of moving means for various periods.

4.3 Availability of Data

There are 5 G&D sites in Tapi Basin. Availability of annual runoff data for these sites is summarized in **Table-17**.

Table-17: Availability of Data

S. no.	Site	Period of Availability	Years
1.	Burhanpur on Tapi River	1973-74 to 2012-13	40
2.	Yerli on Purna River	1973-74 to 2012-13	40
3.	Gopalkheda On Purna River	1977-78 to 2012-13	36
4.	Gidhade On Tapi River	1990-91 to 2012-13	22
5.	Sarangkheda on Tapi River	1977-78 to 2012-13	36
The data is placed at Annexure-1 and shown in line diagram in Fig- 1 .			

4.4 Analysis

4.4.1 Statistical Analysis

Various statistical parameters of the time series of available data are given below in **Table-18**.

Table-18: Statistical parameters of Annual Runoff series at various sites in Tapi Basin

River Gauging Station	Data length (years)	Mean (MCM)	Median (MCM)	standard deviation (MCM)	Co-efficient of variation
Burhanpur	40	4689.6	3970	2460.34	0.525
Yerli	40	2100.5	1822.0	1483.9	0.706
Gopalkheda	36	1020.4	833	714.6	0.700
Gidhade	22	6074.1	4936	3259.1	0.537
Sarangkheda	36	7806.1	6927.5	4434.3	0.560

4.4.2 Fit characteristics

In order to find out if any mathematical equation represents the time series as a function of time, fitting of various types of equations viz. linear, logarithmic, exponential and polynomial have been attempted. Results of such fits are given in the **Table-19** and shown in **Fig 2 through 6**.

Table-19: Fit Characteristics

S. No.	Station name	Standard Deviation σ (MCM)	Coefficient of variance C_v	Mathematical Fit		R^2
1.	Burhan-Pur	2460.34	0.525	Linear	$y = -1.623x + 7925$	0.00006
				Logarithmic	$y = -3278\ln(x) + 29591$	0.00006
				Exponential	$y = 14669e^{-6E-0x}$	0.00
				Polynomial	$y = 0.791x^2 - 3157.x + 3E+06$	0.001
2.	Yerli	1483.9	0.706	Linear	$y = -38.2 x + 78407$	0.091
				Logarithmic	$y = -7629 \ln(x) + 58172$	0.091
				Exponential	$y = 1E+24e^{-0.02x}$	0.134
				Polynomial	$y = 0.158x^2 + 593.x - 55058$	0.091
3.	Gopal-kheda	714.6	0.700	Linear	$y = 1.312x - 1596$	0.00
				Logarithmic	$y = -2599\ln(x) - 18727$	0.00
				Exponential	$y = 45.01e^{0.001x}$	0.00
				Polynomial	$y = 0.421x^2 - 1678.x+2E+0.06$	0.003
4.	Gidhade	3259.1	0.537	Linear	$y = 11.73 x - 17422$	0.00
				Logarithmic	$y = 23496\ln(x) - 17253$	0.00
				Exponential	$y = 3034e^{0.000x}$	0.00001
				Polynomial	$y = -0.32 x^2 + 141.4x - 14720$	0.00
5.	Sarang-kheda	4434.3	0.560	Linear	$y = -39.56x + 86724$	0.008
				Logarithmic	$y = -7875 \ln(x) + 60620$	0.008
				Exponential	$y = e^{0.004x}$	-0.000

				Polynomial	$y = -3.1715x^2 - 14780.x + 1$ E+07	0.015
--	--	--	--	------------	--	-------

4.4.3 Moving Mean Analysis

In [statistics](#), a moving mean (average), also called rolling average, rolling mean or running average, is a type of [finite impulse response filter](#) used to analyze a set of data points by creating a series of [averages](#) of different subsets of the full data set.

The first element of the moving average is obtained by taking the average of the initial fixed subset of the number series. Then the subset is modified by "shifting forward", that is excluding the first number of the series and including the next number following the original subset in the series. This creates a new subset of numbers, which is averaged. This process is repeated over the entire data series. The plot line connecting all the (fixed) averages is the moving average. A moving average is a set of numbers, each of which is the [average](#) of the corresponding subset of a larger set of data points. A moving average may also use unequal weights for each data value in the subset to emphasize particular values in the subset.

A moving average is commonly used with [time series](#) data to smooth out short-term fluctuations and highlight longer-term trends or cycles.

In the present analysis, moving means have been computed for 3, 5 and 7 year periods for various sites of Tapi River Basin and shown in **Fig-7 through 11**.

4.5 Interpretation

4.5.1 Fitting of various statistical/mathematical models viz linear, logarithmic, exponential and polynomial reveals that values of R^2 range from 0.00 to 0.001 for Burhanpur, from 0.091 to 0.134 for Yerli, from 0.000 to 0.003 for Gopalkheda, from 0.000 to 0.00001 for Gidhade, and 0.00 to 0.015 for Sarangkheda. The values of R^2 are quite close to 0 indicating absence of any significant trend.

4.5.2 As regards the Purna, tributary of river Tapi, a decreasing trend is seen at site Yerli from the plot of moving mean averages from about mid-nineties, which again shows signs of rising by 2010, though no trend is visualized on the upstream site Gopalkheda on Purna. On the main stream Tapi, it may be seen from the moving mean analysis that there does not appear any significant trend as observed from 3 year moving mean. But as we prolong the period of mean, cyclicalness or periodicity

begins to appear. However, in view of the limited length of data series, it may be premature to conclude that there exists a definite cyclic trend in the annual runoff data.

4.6 Conclusion

Statistically speaking, the annual runoff of river Tapi and its tributary Purna, in general, appears to be a random variable; however elements of cyclicalness cannot be ruled out on the strength of moving mean analysis. A longer set of time series data may help identify trends in annual runoff, if any.
