प्रस्तावना

हमारे पूर्वज यह जानते थे कि पृथ्वी पर जीवों का जीवन तभी स्वस्थ , सुखी और दीर्घ रह सकता है, जब शुद्ध जल और शुद्ध वायु की उपलब्धता हो ।

नदी घाटियों के समुचित नियोजन, संरक्षण और विकास में प्रभावी कार्यवाही के लिये केंद्रीय जल आयोग एक शीर्षस्थ तकनीकी संस्था के रूप में कार्यरत है । इस संस्था द्वारा विभिन्न जल विज्ञानीय प्रेक्षण तंत्र का प्रबोधन भारत की वृहद तथा मध्यम नदियों पर स्थित विभिन्न स्थलों से संचालित है । जल के प्रबोधन के लिये इन्हीं कुछ महत्वपूर्ण स्थलों से जल नमूने एकत्रित किये जाते हैं । नर्मदा नदी के जल गुणवत्ता प्रबोधन से संबंधित आकड़ों का संकलन, नर्मदा मंडल, भोपाल तथा ताप्ती मंडल, सूरत स्थित प्रयोगशालाओं में किया जाता है । नर्मदा बेसिन के लिये इन आकड़ों का संकलन वर्ष 1978-79 में सात स्थलों से शुरू किया गया था, जिसमें क्रमिक बढ़ोतरी कर वर्ष 2019 तक 16 स्थल किया गया था । नदी आंकड़ा संकलन निदेशालय - II के पत्र क्रमांक File No.T-100014/5/2019-RD-II DTE, दिनांक- 15.10.2019 के निर्देशानुसार वर्ष 2019-20 में 16 नवीन जल गुणवत्ता स्थलों पर जल गुणवत्ता का कार्य शुरू किया गया । मार्च 2023 से स्थानीय जल निकाय, भोपाल (म.प्र.) के अंतर्गत भोजताल की जल गुणवत्ता विश्लेषण का कार्य आरंभ किया गया है । वर्तमान में 33 स्थलों पर जल गुणवत्ता आकड़ों का आकलन कार्य किया जा रहा है ।

नर्मदा नदी की जल गुणवत्ता के प्रभावी प्रबोधन हेतु जल गुणवत्ता आंकड़े पुस्तक का प्रकाशन किया जा रहा है । इस पुस्तक में वर्ष 20 23-24 के दौरान नर्मदा बेसिन में 33 स्थलों के विश्लेषण आकड़े संकलित किये गए हैं । संकलित आकड़ों के आधार पर ही जानकारी इस पुस्तक में समाहित है इसके अलावा प्रेक्षण तकनीक, आकलन पद्धति, स्थलवार वृत्तपत्र, रासायनिक घटक आदि भी इस पुस्तक में उल्लेखित हैं ।

वर्ष 2022 में नर्मदा बेसिन नदी जल गुणवत्ता प्रयोगशाला (NBRWQL), CWC, भोपाल का परीक्षण के क्षेत्र में मानक ISO/IEC 17025:2017 "परीक्षण और अंशांकन प्रयोगशालाओं की क्षमता के लिए सामान्य आवश्यकताएं " के अनुसार राष्ट्रीय परीक्षण और अंशशोधन प्रयोगशाला प्रत्यायन बोर्ड (NABL) द्वारा मूल्यांकन और मान्यता दी गई है ।

आशा है इस पुस्तक में दी गयी जानकारियां एवं संकलित आकड़े, जल-गुणवत्ता एवं प्रबंधन के क्षेत्र में कार्य कर रही संस्थाओं के लिए काफी लाभप्रद रहेंगे, इस पुस्तक को और अधिक उपयोगी बनाने के लिये सुझाव आमंत्रित है ।

इस पुस्तक के आकड़ों से संकलन, विश्लेषण तथा प्रकाशन हेतु नर्मदा बेसिन संगठन के अधिकारियों एवं कर्मचारियों ने समर्पण की भावना से एक दल के रूप में जो कार्य किया है, वह प्रशंसनीय है, मैं सभी का आभार व्यक्त करता हूँ ।

PREFACE

The Central Water Commission is functioning as an apex technical body for effective action in proper planning, conservation and development of river basins. The monitoring of various hydrological observation systems by this institution is conducted from various sites located on the major and medium rivers of India. Water samples are collected from some of these important places for monitoring of water quality. The data related to water quality monitoring of Narmada River is collected in laboratories located in Narmada Division, Bhopal and Tapi Division, Surat. The compilation of these data for Narmada basin was started in the year 1978-79 from seven sites ,further it was gradually increased to 16 sites by the year 2019. As per the instructions given by River data compilation-II Directorate, letter number File No.T-100014/5/2019-RD-II DTE, dated-15.10.2019, water quality work has been started at 16 new water quality sites in the year 2019-20. From March 01, 2023, the work of water quality analysis of Bhojtal has been started under the local water body at Bhopal (M.P.). At present the work of assessment of water quality data is being done at 33 places.

The “Water Quality Data Book” is being published for effective monitoring of the water quality of Narmada River. In this book, analysed data of 33 sites in Narmada basin have been compiled during the year 2023-24. Information contained in this book is only on the basis of the collected data. Apart from this, observation techniques, estimation method, site wise circular, chemical components etc. are also mentioned in this book.

During year 2022 Narmada Basin River Water Quality Laboratory (NBRWQL), CWC, Bhopal had been assessed and accredited in accordance with the standard ISO/IEC 17025:2017 "General Requirements for the Competence of Testing & Calibration Laboratories" in the field of Testing by National Accreditation Board for Testing and Calibration Laboratories (NABL).

Hope the information and collected data given in this book will be very beneficial for the organizations working in the field of water quality and management; suggestions are invited to make this book more useful.

The work done by the officers and employees of Narmada Basin Organization in the form of a team with the spirit of dedication for compilation, analysis and publication of the data for this book is commendable for which I express my gratitude to all.

1. Introduction

1.1 Water Quality Activities of CWC

Central Water Commission (CWC) is playing an important role in the field of water quality monitoring of river water. CWC is monitoring the water quality of river since 1963. In the beginning, water quality observation work was started for observing the river water for its suitability for irrigation purpose. By year 2000, water quality parameters were observed in CWC at 353 locations as a value addition to water quality. As on 01.01.2022, CWC is observing water quality at 790 key locations (655 on Hydrological Observation network and 135 Water Quality Sampling Sites).

At present, CWC follows a three-tier laboratory system which consists of Level I, II and III types of laboratories for providing analytical facilities for the analysis of river water samples collected from water quality monitoring stations covering all the important river basins of India.

1. Level-I Laboratories: These are the field laboratories located at field water quality monitoring stations on various rivers of India, where analysis of 6 in-situ parameters: Temperature, Colour, Odour, pH, Electrical Conductivity (EC) and Dissolved Oxygen (DO) of river water are being monitored. As on January 2022, there are 410 Level-I laboratories located at field water quality monitoring stations situated on various rivers of India.

2. Level-II Laboratories: There are 19 level-II laboratories located at division offices of CWC to analyse 25 physico-chemical and biological parameters of river water.

(* Divisional Laboratory, Bhopal is a Level-II laboratory.) (refer table 2-2)

3. Level-III Laboratories: There are 5 regional Level-III laboratories for analysis of 41 parameters including trace & toxic metals and pesticides. Level-III labs are located at New Delhi, Varanasi, Guwahati, Hyderabad and Coimbatore.

1.2 Scope

Watersheds are valuable resource for the country. Adequate knowledge of these watersheds is necessary for a rational formulation of water management policies. Moreover, growth of anthropogenic activities in river basins may lead to river pollution. Keeping this in mind, Central Water Commission observed a number of Physico-chemical parameters of surface water to understand the water quality of large watersheds.

Narmada Basin is the fifth largest among the twelve major river basins of the country. Narmada is an interstate river having total length of 1312 km, of which 1079 km flows in Madhya Pradesh, 35 km flows along the common border of Madhya Pradesh and Maharashtra, 39 km flows along the border of Maharashtra, and Gujarat and 159 km flows in Gujarat. The total basin area is approximately 98796 sq km, out of which 85859 sq km lies in Madhya Pradesh, 1538 sq km in Maharashtra and 11399 sq km. lies in Gujarat. The river originates from the Amarkantak Plateau of Maikal range at about 1057 metre above Mean Sea Level (MSL) and major part flows through

narrow elongated through running east to west with slight inclination towards the south, before it drains into the Arabian Sea at the Gulf of Khambat near Bharuch in Gujarat.

In its 1312 km long stretch, tributaries of various sizes contribute water and their pollution load to the Narmada River. A characteristic change in the water quality is expected when the tributaries join the river. There are about 19 major tributaries of Narmada listed by Narmada Water Disputes Tribunal, out of which eight are being considered for water quality assessment during present observation period.

1.3 Sources of Information

During the reporting period of 2023-24 the results of water sample analysis carried out in the laboratory at Narmada Division Bhopal are compiled in this report. The water samples were collected at 35 hydro meteorological and water quality monitoring stations in Narmada basin on monthly basis, the same are shown in Plate-1. Out of 35, 33 water quality stations are functioning under the administrative control of Narmada Division, Bhopal while two stations (at Sl No. 1 and 2 of the Table1-1) are under the administrative control of Tapi Division, Surat. These stations are functioning under plan scheme viz. “Development of Water Resources Information System”, during 12th Five Year Plan. The sites and the codes of Water Quality Observation Stations in the Narmada basin are given in Table 1-1.

2. Water Quality Observation

2.1 Sampling

The periodicity of collection of water samples is Ten daily basis i.e. thrice in a month provided that the samples reaches to the Divisional Laboratory at Bhopal on the next day. These water samples are collected at 0.6 times the depth from surface without disturbing the bottom sediments, from the point across the river section having maximum depth or maximum flow along the cross section of the river, so that sample must be representative of the source (i.e. water stream) that is to be evaluated. The samples are collected in clean and pre-rinsed plastic bottles of one litre capacity, filled up to their full capacity without air bubbles. Measurements of some other parameters like in-situ temperature; depth, velocity of water etc. are written on paper and a label containing name of site, date of collection etc is pasted on the polythene bottles for identification. The water samples thus collected are sent for analysis to Divisional Laboratory Bhopal by special messenger so as to reach within 24 hours of collection for minimum changes.

2.2 Analysis of Parameters at Laboratories.

Six In-situ parameters are analysed at Nine Level-I laboratories situated at WQ sites. The water samples received at Divisional Laboratories are stored in Cooling Cabinet and analysed for various physical, chemical and biological parameters as mentioned in **Table 2-1**

2.3 Method of Analysis

The water sample preserved in laboratory is analysed using "STANDARD METHODS FOR THE EXAMINATION OF WATER AND WASTE WATER" – APHA 24th Edition 2023, AWWA & WEF, which are quick, usually much faster than purely chemical procedures and suited for number of routine analysis. The quantitative estimation for the parameters detailed above are determined by titrimetric methods, electrical methods and optical methods. The applications of different methods to analyse physical and chemical characteristics of water sample are summarized below.

Physical Characteristics

The major physical characteristics or parameters of water are,

- **Discharge** in cumecs is measured by current meter and this average rate of volume of water with concentration of pollutant give the possibility to detect significant pollution sources and its peaking factor.
- **Colour** in water is the result of dissolved extracts from metals in rocks and soil, from organic matter in soil and plants, and occasionally from industrial by-products. The colour of the water sample is determined by visual comparison method.
- **Odour** of the water sample is determined by qualitative human receptor method.
- The in-situ **temperature** in degree centigrade is measured by thermometer and is recorded to decide the intended use of water, the treatment process to remove impurities and its transport.
- The **pH** of water is measure of the acidic or basic nature of the water. Water with pH lower than 7 are acidic and those with a higher pH are basic. This is observed with a pH meter which actually measures the electrical potential exerted by the H⁺ ions.
- Measuring its **electrical resistance** between two electrodes dipped in the sample and comparing its resistance with the resistance of a standard solution of potassium chloride at 25° C by Electrical Conductivity meter determines the conductivity of the water sample. The value of conductivity coefficient is measured in micro-mhos/cm and is an indicator of type of dissolved salts in water.
- **Total Dissolved Solids (TDS)** concentration in mg/l, in conjunction with a detailed chemical analysis, is used to assess the suitability of various water sources for alternative uses such as industry or agriculture. Its value should be between 0.55 and 0.70 of the conductivity coefficient. This is measured with a potentiometer.
- **Turbidity** is defined as the presence of soil particles, clay, silt and other colloidal impurities in the water which obstruct the passage of light through water and hence decreases the clarity of water. The degree of turbidity measured in NTU depends on the fineness of the particles and their concentration. This is measured with a turbidity meter (discussed under nepHelometric method) by measuring the interference to the passage of light through a water sample. Surface waters in which there is significant increase in the level of turbidity after a rainfall are often identified as "flashing waters". Such water is more difficult to treat than waters in which the level of turbidity remains reasonably constant.

Chemical Characteristics

The common tests used to quantify the inorganic constituents of water are:

- **Titrimetric Method:** The term titrimetric analysis refers to quantitative chemical analysis carried out by determining the volume of a solution of accurately known concentration (standard solution), which is required to react with the known volume of solution of the substance to be determined. The end point of titration is detectable by perceptible change of colour of the solution produced usually by the addition of an auxiliary reagent known as indicator. Parameters determined by this technique are **Carbonate, Bicarbonate, Chloride, Calcium, Magnesium, Dissolved Oxygen [DO] and Biochemical Oxygen Demand [BOD]**.
- **Spectrophotometric/ Colorimetric Method:** This instrument works on measurement of the amount of optical energy of a particular wavelength absorbed/transmitted by the solution. The instruments used in this method are UV Double Beam Spectrophotometer. A series of standard solutions of known concentration are prepared and treated with appropriate reagents to produce colored solution. Then the light of specific wavelength is passed through the standard solutions. The transmittance / absorbency is plotted against the concentration and this is termed as calibration or reference curve. Water samples are treated with the same reagents for colour development under the same experimental conditions and then transmittance/ absorbance is measured. Concentration of the constituent is being determined from calibration curve. Parameters analysed by this method are **Nitrate, Nitrite, Phosphate and Silicate, Chemical Oxygen Demand [COD]**.
- **Ion Selective Electrode Method:** Ion selective electrode (ISE) is an analytical technique used to determine the activity of ions in aqueous solution by measuring the electrical potential. Parameters analysed by this method are **Ammonia-N, Fluoride**.
- **Flame Spectrophotometry Method:** This is also an optical method of analysis based on measurement of the amount of energy of a particular wavelength emitted. If a solution containing a metallic salt is aspirated into a flame, the metal atoms are excited by the thermal energy of the flame and then electrons in the ultimate shell go to higher energy levels and eventually return to ground state and emit the energy in form of radiation. The filter, interposed between the flame and the photocell detector, is used to select a given emission line. To convert the measured emission values into the concentration of the substance being determined, a calibration curve is plotted by aspirating into the flame, samples of solutions containing known concentration of salts (standard solution). A graph is plotted with measured emission against the concentration of solutions. Then the test samples are aspirated for flame emission and emission intensity is measured. From these values of emission from unknown test solution, concentration of substance can be determined from the calibration curve. Parameters estimated through this method are **Sodium and Potassium**.
- **Nephelometric Method:** The measurement of the intensity of the scattered light at right angles to the direction of the incident light as a function of the concentration of the solution is the basis of nephelometric analysis. The calibration curve is plotted by measuring the scattering intensity of standard sulphate solutions added with barium chloride to inhibit the growth of micro crystals of barium sulphate against concentration of solution. Then the test samples are allowed for scattering. The concentration of sulphate-ion content of unknown solution is determined from the calibration curve. Turbidity of the water sample is measured directly by calibrating the instrument with standard turbid solution of 10% Hexamethylene

and 1 % Hydrazine sulphate. The parameter analysed by nephelometric method are **Sulphate and turbidity**.

2.4 Explanatory Notes

For dissemination of processed information, the water quality database has been tabulated in succeeding pages for making realistic assessments. The information is grouped under two headlines, namely, History Sheet and Water Quality Data of hydrological station. Tabular summaries bring together processed data from selected stations detailed previously in this book. These explanatory notes below are designed to assist in the interpretation of characteristics incorporated in the book.

- Frequency of publication of “**Water Quality Data Book**” is annual and water year starts from 1st June of every calendar year to the 31st May of the next calendar year and covers one complete hydrological cycle. This book presents updated water quality data for the period 1st June 2023 to 31st May 2024.
- In the history sheet, a catalogue is designed to identify the hydrological records grouping name of river basin, site, drainage area, latitude & longitude of site, station type, period of the stream flow.
- Every permanent site is given a unique identifier code that will be used to denote all data and other Information pertinent to the site. A unique nine-column numeric code system is used for site identification to facilitate multi data storage and its retrieval. The first two columns are identifiers measuring authority. Third and fourth columns are for drainage zone/basin. Fifth and Sixth columns are for Independent River and last three i.e. seventh, eighth and ninth columns are for station numbers within the region.
- The following four chemical indices namely Hardness number, Sodium percentage, Sodium Absorption Ratio and Residual Sodium Carbonate are calculated by empirical formula taking different observed values. These are detailed below:

Hardness number

Calcium and Magnesium are the principle ions that make the water hard. Hardness is expressed in milligrams per litre of equivalent Calcium Carbonate. Hardness Number is expressed by:

$$\text{Hardness Number} = (\text{Ca}^{++} + \text{Mg}^{++}) \times 50$$

Sodium percentage

Salts of Calcium, Magnesium, Sodium and Potassium in irrigation water are critical for almost all crops. In excessive quantities these salts reduce the osmotic activity of plants, preventing the absorption of nutrients by plant and indirect chemical effects on the metabolism of the plant. These ions also affect soil permeability, preventing adequate drainage or aeration. Percent Sodium is defined as the percentage of the Sodium content of water in the total cations content.

Sodium percentage is determined by dividing the Sodium content by the sum of Calcium, Magnesium, Sodium and Potassium contents by formula given below:

$$\text{Sodium Percentage} = \frac{\text{Na}^+ \times 100}{\text{Ca}^{++} + \text{Mg}^{++} + \text{Na}^+ + \text{K}^+}$$

(all expressed as milliequivalents per litre)

Sodium Absorption Ratio

Since Calcium and Magnesium will replace Sodium more readily than vice versa, the ratio reflects the Sodium hazard. The SAR indicates the relative activity of the Sodium ions in exchange reactions with the soil. Irrigation water with a high SAR will cause the soil to tighten up. The Sodium Adsorption Ratio (SAR) is defined as:

$$\text{Sodium Absorption Ratio} = \frac{\text{Na}^+}{\left[\frac{(\text{Ca}^{++} + \text{Mg}^{++})}{2} \right]^{1/2}}$$

Residual Sodium Carbonate

Residual Sodium Carbonate is calculated using the following formula

$$\text{Residual Sodium Carbonate} = (\text{CO}_3^{--} + \text{HCO}_3^-) - (\text{Ca}^{++} + \text{Mg}^{++})$$

The U.S. Department of Agriculture has classified irrigation waters in four groups depending on SAR and the specific conductance (Diagram for classification and use of Irrigation Water is given at **Annexure -1**. Classification of water sample for suitability of agriculture as per salinity diagram is indicated lastly on compilation sheet.)

2.5 Validation of Water Quality data

Primary validation of water quality data is done by the laboratory where the water samples are analysed and analysis results entered.

Prior to primary validation, results and entries should be again inspected for complete information and errors. Make sure that data entry and typing mistakes are not there, check for the significant figures and fractional digits. Check whether result is within the detection limits of the method of analysis and within the expected range of a parameter.

Primary Validation

Ion balance between major cations and major anions should not exceed 5 %.

$$\text{Ionic Balance} = \frac{\text{[Total Cations} - \text{Total Anions}]}{\text{[Total Cations} + \text{Total Anions}]} * 100$$

all concentrations in milli equivalents/litre (m.eq/L)

- Sodium and Chlorine ratio – the ratio should be between 0.8 and 1.2 (concentrations in milli equivalents/L).
- Total Dissolved Solids (TDS) and Conductivity (EC) ratio – the ratio should be between 0.55 and 0.9
- COD and BOD ratio – COD values should always be higher than BOD values
- Carbonate and pH relationship – carbonate should be zero for pH values below 8.3
- Total coliform and faecal coliform ratio – TC values should be higher than FC values
- Total hardness = Ca hardness + Mg hardness
- The value of measured EC should be close to the value of calculated EC.
- TDS calculated and TDS measured ratio – the ratio should be between 1.0 and 1.2
- Presence of nitrate in the absence of dissolved oxygen may indicate an error since nitrate is rapidly reduced in the absence of oxygen.

Primary validation of analysis results is required to be completed immediately, preferably within one week. This time schedule ensures that any obvious problems (e.g., indicating an instrument malfunction, observer error etc.) are spotted at the earliest opportunity and resolved. Other problems may not become apparent until more data have been collected, and data can be viewed in a longer-term context during secondary validation.

Secondary validation

Secondary validation is largely concerned with detecting outliers. An outlier is an observation that does not match the pattern of earlier observations. They may be identified by using the historical dataset for a particular parameter for a particular station using control charts/graphical analysis (Refer Chapter 5: Water Quality Handbook: Sediment and Water Quality, HP II, Indian Hydrology Project, May 2014). Outliers in water quality datasets may occur due to practical mistakes or instrumental failure in all aspects of water quality sampling and analysis: from sample collection, transport, storage, analysis or data entry. They may also result from transcription or

data entry errors, or can be the result of instrument breakdowns, calibration problems or power failures.

However, outliers may be an indication of a true change in the system under study, such as an accidental spill on a river stretch. The presence of one or more outliers within a data set may greatly influence any calculated statistics and yield biased results, so outliers should be identified, flagged and, if truly erroneous, possibly removed from a dataset.

If outliers are identified

- i. The value may be confirmed by rechecking/recalculation. If an obvious mistake is detected, the correct data value may be entered, if available. Remove from the dataset, if they are truly erroneous and retesting of sample is not possible.
- ii. If retesting is possible, outliers may be removed by reanalysis of the sample in the laboratory itself.
- iii. If outlier is not removed by step ii, the sample may be sent to the nearest laboratory of CWC.
- iv. If the value is confirmed; outlier is not removed by step iv also, the values may be entered in the WQ bulletin; flagged. The probable reason of the unusual value may be indicated in remarks.

3. Analysis Results

3.1 General

Based on discussion presented in Chapter 1 and 2, the results of chemical analysis carried out at each of 35 sites in respect of 21 parameters are presented in this chapter.

Method of Presentation

In the succeeding pages station wise water quality data/ parameters are presented comprising of history sheet and water quality analysis results in tabular form. The series of the water quality observation stations is arranged from the mouth of the river to the upstream giving priority to an intermediate tributary station in a similar fashion.

History sheets give brief description of the water quality observation station. The water analysis result tables are given for the river water only and for the parameters analysed at the site and at the laboratory. The table showing tolerance limits of water quality parameters for various uses of water as per IS: 2296-1992 is given as Annexure -2.
